Development of Catalytic Strategies and Microreactor Technology for the Synthesis of Bio-Based Furanics from Lignocellulose-Derived Carbohydrates

PhD thesis

to obtain the degree of PhD at the
University of Groningen
on the authority of the
Rector Magnificus Prof. C. Wijmenga
and in accordance with
the decision by the College of Deans.

This thesis will be defended in public on

Friday 3 September 2021 at 9.00 hours

by

Wenze Guo

born on 20 November 1991
in Fujian, China

Supervisors

Prof. J. Yue

Prof. H.J. Heeres

Assessment Committee

Prof. A.M.R. Galletti

Prof. W. de Jong

Prof. P.P. Pescarmona

Table of Contents

Chapter 1. Transformation of Lignocellulose Derived Carbohydrates to Bio-based Furanic Platform Chemicals: Catalytic Strategies and Process Intensification by Microreactor Technology..... 1

Abstract..... 2

1.1. Introduction 2

1.1.1. Overview on the energy consumption and renewables 2

1.1.2. Biomass transformation to chemicals and fuels 3

1.1.3. Process intensification for furanic synthesis 10

1.1.4. Microreactor technology..... 12

1.1.5. Scope of this review 15

1.2. Mechanistic aspects of the synthesis of HMF and furfural 17

1.2.1. Synthesis of HMF from glucose and fructose..... 17

1.2.2. Synthesis of furfural from xylose..... 20

1.3. Industrial and pilot scale production of HMF and furfural 23

1.3.1. HMF production 23

1.3.2. Furfural production 23

1.4. Catalytic strategies for the synthesis of HMF and furfural..... 28

1.4.1. Homogeneous catalytic systems for furanic synthesis 28

1.4.2. Heterogeneous catalytic systems for furanic synthesis..... 30

1.5. Reaction media and solvent systems 34

1.5.1. Water and aqueous-organic biphasic solvent systems..... 34

1.5.2. Polar aprotic organic solvents 36

1.5.3. Ionic liquids 36

1.5.4. Deep eutectic solvents 37

1.6. Process intensification by continuous flow microreactors 41

1.6.1. Homogeneous catalysis with monophasic solvent system 41

1.6.2. Homogeneous catalysis with multiphase solvent system 45

1.6.3. Heterogeneous catalysis..... 55

1.6.4. Advantages, challenges and future perspectives 65

1.7. Scope and outline of this thesis	72
Reference	75
Chapter 2. Efficient synthesis of furfural from xylose over HCl catalyst in slug flow microreactors promoted by NaCl addition.....	87
Abstract.....	88
2.1. Introduction	88
2.2. Experimental.....	91
2.2.1. Materials.....	91
2.2.2. Experimental setup and procedure	92
2.2.3. Analyses and characterization.....	93
2.2.4. Definitions and calculations	94
2.3. Results and discussion	95
2.3.1. Monophasic experiments: effect of NaCl addition, acid and substrate concentrations, and temperature	95
2.3.2. Biphasic experiments: effect of O/A, NaCl addition and temperature.....	97
2.3.3. Kinetic modelling studies	99
2.3.4. Process optimization in microreactors and catalyst recyclability.....	111
2.3.5. Performance comparison with the literature.....	113
2.4. Conclusion	114
Reference	115
Supplementary Material – Chapter 2.....	118
S2.1. Performance of literature work on furfural synthesis from xylose and their comparison with this work.....	119
S2.2. Experimental conditions for monophasic experiments in water in the microreactor	121
S2.3. Overview of the representative kinetic models on xylose dehydration over homogeneous acid catalysts in water	123
S2.4. Calculation of the actual phasic flow rate under the reaction temperature and the residence time in the microreactor.....	129
S2.5. Determination of the partition coefficient of furfural between water and MIBK.....	134
S2.6. Calculation of the flow rate change ratio between the microreactor inlet and outlet	138
S2.7. Effect of acid/substrate concentration and temperature in monophasic experiments in the microreactor	139

S2.8. Effect of O/A, NaCl addition and temperature in biphasic experiments in the microreactor	141
S2.9. Further calculations to support the kinetic modelling in the microreactor	142
S2.10. Comparison of experimental results with the literature model predictions.....	156
S2.11. Comparison of the estimated activation energies between this work and the literature.....	161
S2.12. Model implications	163
Reference.....	169
 Chapter 3. Selective Fructose Dehydration to 5-Hydroxymethylfurfural from a Fructose-glucose Mixture over a Sulfuric Acid Catalyst in a Biphasic System: Experimental Study and Kinetic Modelling.....	173
Abstract.....	174
3.1. Introduction	174
3.2. Experimental methods	180
3.2.1 Materials.....	180
3.2.2 Experimental procedures	181
3.2.3 Analysis and characterization	182
3.2.4 Definitions and calculations	183
3.3. Results and discussion.....	185
3.3.1 Experimental studies in batch reactors	185
3.3.2 Kinetic modelling studies	194
3.3.3 Model implications for the conversion of fructose-glucose mixture in the biphasic system.....	206
3.3.4 Optimized HMF synthesis in a slug flow microreactor	210
3.4. Conclusion	212
Reference	214
 Supplementary Material – Chapter 3.....	220
S3.1. Overview of the representative kinetic models on sugar dehydration in water	221
S3.2. Experimental conditions for monophasic experiments in water in batch reactors	225
S3.3. Determination of partition coefficient	226
S3.4. Estimation of the volume change ratio of the aqueous or organic phase after mixing and reaction	228

S3.5. Effect of reaction temperature and concentration on the conversion of sugars and HMF in the monophasic water system in batch reactors	235
S3.6. LA conversion in the monophasic water system in batch reactors	237
S3.7. Heating profile in batch reactors	238
S3.8. Estimation of the catalytic role of formic acid and levulinic acid	240
S3.9. Reaction order in the catalyst.....	241
S3.10. Mass transfer limitation in batch reactors.....	242
S3.11. Further comparison between the experimental results and model predictions under representative reaction conditions	243
S3.12. Comparison of the experimental data with literature model predictions	244
S3.13. Comparison of the estimated activation energies between this work and literatures...	247
S3.14. Kinetic modelling of the conversion of fructose-glucose mixture in the biphasic system in an ideal batch reactor	249
S3.15. Modelling HMF synthesis from fructose-glucose mixture in the biphasic system in continuous flow reactors.....	255
S3.16. Optimized HMF synthesis in batch reactors	257
S3.17. Conversion of fructose-glucose mixture to HMF in a slug flow microreactor with the addition of NaCl.....	258
Reference	259
 Chapter 4. Continuous Synthesis of 5-Hydroxymethyl-furfural from Glucose Using a Combination of AlCl₃ and HCl as Catalyst in a Biphasic Slug Flow Capillary Microreactor	 261
Abstract.....	262
4.1. Introduction	262
4.2. Experimental section.....	265
4.2.1. Materials.....	265
4.2.2. Experimental setup and procedure.....	265
4.2.3. Analyses and characterization.....	267
4.2.4. Definitions and calculations	268
4.3. Results and discussion	269
4.3.1. HMF synthesis from glucose using a combined AlCl ₃ /HCl catalyst in a biphasic slug flow capillary microreactor	269
4.3.2. Role of catalyst components: experiments with glucose and reaction intermediates using	

AlCl ₃ or HCl as catalyst in the slug flow capillary microreactor	271
4.3.3. Effect of Brønsted acidity on the AlCl ₃ /HCl-catalyzed glucose conversion in the slug flow capillary microreactor	276
4.3.4. Further Insights into the variation of the catalytically active Al species with Brønsted acidity and the pH dependency of the glucose conversion	280
4.3.5. Further screening of the reaction conditions for optimized HMF yield	283
4.3.6. Performance comparison of microreactors with a laboratory batch reactor study and the literature work.....	285
4.3.7. Recyclability and reusability of the AlCl ₃ /HCl catalyst system.....	288
4.4. Conclusion	289
References.....	290
Supplementary Material – Chapter 4.....	295
S4.1. Calculation of the residence time and actual phasic flow rate under the reaction temperature in the microreactor	296
S4.2. Calculation of the flow rate change ratio between the microreactor inlet and outlet	298
S4.3. Levulinic acid conversion experiments in the microreactor.....	299
S4.4. Additional experiments on the glucose conversion to HMF with different AlCl ₃ concentrations in the microreactor.....	300
S4.5. Effect of Brønsted acidity on the glucose conversion using HCl as catalyst in the microreactor.....	300
S4.6. Glucose conversion with different glucose concentrations and catalyst loadings	301
S4.7. Experiments in a laboratory batch reactor.....	301
S4.8. Measurement and calculation of the heating profile of different liquids in the batch reactor and microreactor	304
S4.9. Definition and calculation of the space time yield in the batch reactor and microreactor	308
References	310
Chapter 5. Selective Tandem Catalysis for the Synthesis of 5-Hydroxymethylfurfural from Glucose over In-situ Phosphated Titania Catalysts: Insights into Structure, Bi-functionality and Performance in Flow Microreactors	311
Abstract.....	312
5.1. Introduction.....	312
5.2. Results and discussion.....	317

5.2.1. Physiochemical properties of the in-situ phosphated titania catalyst	317
5.2.2. Glucose conversion to HMF in the batch reactor	327
5.2.3. Insights into bi-functionality of the in-situ phosphated titania catalyst	330
5.2.4. Relationship between the synthesis method, structure, acidic property and reaction performance of the in-situ phosphated titania.....	337
5.2.5. Glucose conversion to HMF in the packed-bed microreactor.....	339
5.2.6. Evaluation of the stability and recyclability of the in-situ phosphated titania catalyst in the packed-bed microreactor	341
5.2.7. Performance comparison with the literature work and future perspective for microreactor optimization.....	343
5.3. Conclusion	347
Reference	348
Supplementary Material – Chapter 5.....	355
S5.1. Experimental section	356
S5.2. Additional results of catalyst characterization	363
S5.3. Additional results of reaction test	366
