1. General Remarks

All reactions were carried out under a nitrogen atmosphere using flame dried glassware. All the ligands and $\text{CuBr}\cdot\text{SMe}_2$ were purchased from Aldrich and used without further purification. Grignard reagents were prepared from the corresponding alkyl bromides and magnesium turnings in Et_2O following standard procedures. Grignard reagents were titrated using *s*-BuOH and catalytic amounts of 1,10-phenanthroline. Solvents were purified before use employing standard techniques.¹

Chromatography: Merck silica gel type 9385 230-400 mesh, TLC: Merck silica gel 60, 0.25 mm. Components were visualized by staining with a solution of a mixture of KMnO_4 (10 g) and K_2CO_3 (10 g) in H_2O (500 mL). Progress and conversion of the reaction were determined by GC-MS (GC, HP6890; MS HP5973) with an HP1 or HP5 column (Agilent Technologies, Palo Alto, CA) or by ^1H -NMR spectroscopy. Mass spectra were recorded on a AEI-MS-902 mass spectrometer. All ^1H NMR and ^{13}C NMR/APT spectra were recorded on Varian Mercury Plus (400 MHz) spectrometer using CDCl_3 as solvent. Chemical shift values are reported in ppm with the solvent resonance as the internal standard (CHCl_3 : δ 7.26 for ^1H , δ 77.0 for ^{13}C). Data are reported as follows: chemical shifts, multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, br = broad, m = multiplet), coupling constants (Hz), and integration. Melting points were determined on a Buchi B-545 melting point apparatus. Optical rotations were measured on a *Schmidt + Haensch* polarimeter (Polartronic MH8) with a 10 cm cell (*c* given in g/100 mL). Enantioselectivities were determined by HPLC analysis using a Shimadzu LC-10ADVP HPLC equipped with a Shimadzu SPD-M10A/VP diode array detector.

2. Experimental Section

2.1 General procedure for copper catalyzed *hetero-allylic asymmetric alkylation*:²

Starting material **1** was synthesized according to the procedure of Trombini and Lombardo et al.³ The Grignard reagent (2–3 equiv in Et₂O) was added dropwise over 5 min to a homogeneous, stirred and cooled (–75 °C or –55 °C) solution of the allylic bromide **1** (303 mg, 1.12 mmol), CuBr·SMe₂ (6.7 mg, 3 mol%) and (*R,R*)-(+)-TaniaPhos (27.7 mg, 3.6 mol%) in CH₂Cl₂ (3.5 mL) under a nitrogen atmosphere. NMR or TLC analysis showed the reaction had reached completion (typically overnight) and the reaction was quenched with MeOH (5 mL). The reaction mixture was removed from the cooling bath and sat. aq. NH₄Cl (5 mL) was added. The mixture was partitioned between CH₂Cl₂ (5 mL) and water. The organic layer was dried (MgSO₄), filtered and the solvent evaporated *in vacuo*. Purification by flash chromatography over silica gel, using Et₂O/*n*-Pentane 1% to 2% to afford the product **2** as colorless oils in good to excellent yield (78%–91%).

$\text{BF}_3 \cdot \text{OEt}_2$ (140 μL , 1.11 mmol) was added dropwise to a suspension of trisubstituted lactone (0.074 mmol) and HgO (80 mg, 0.368 mmol) in $\text{THF}/\text{H}_2\text{O}$ (4:1, 1 mL). After stirring at room temp. for 23 h, H_2O (2 mL) and EtOAc (2 mL) were added. The organic solvent was separated. The aqueous solution was extracted with EtOAc (5 mL) for three times. The combined organic phases were washed with brine and dried over MgSO_4 , and the solvent was removed by rotary evaporation. Flash chromatography (n -Pentane/Ether 1/1 to 1/4) gave the product **6**.
