Control experiments

A number of control experiments were performed to establish that the observed ee indeed is the result of an enantioselective hydration and not from an alternative process, such as for example an enantioselective retro-aldol/aldol sequence. A retro-aldol reaction of the β -hydroxy ketone would yield pivaldehyde and 2-acetyl imidazole, which could lead to R-enriched **2a** via a kinetic resolution. However, no trace of 2-acetyl-(1-methyl)imidazole was detected by reversed phase hplc during the reaction. Moreover, scrambling experiments by addition of benzaldehyde or valeraldehyde to the reaction did not give rise to any other products than **1a** and **2a**. Moreover, the conversion and enantioselectivity obtained were also the same as before. Finally, the labelling experiments using D₂O are inconsistent with such a pathway.

No shift of the OH proton was observed in the range between 2-10 mM, which demonstrates that intermolecular hydrogen bonds are not formed at these concentrations. Only at very high concentrations of **2a** a small shift of the OH proton was observed.

Figure S9: Normalized IR spectra of **2a** in CDCl_3 . a) 10 mM. b) 40 mM. c) 500 mM. Peaks in the region $2800 - 3050 \text{ cm}^{-1}$ originate from the imidazole ring. Peaks at 3133 , 3144 , and 3151 cm^{-1} are artefacts due to solvent subtraction. The broad peaks at 3322 and 3523 cm^{-1} can be assigned to vibrations from hydrogen bonded O-H groups. Hence, a vibration due to a free O-H group is not observed. The peak at 3700 cm^{-1} originates from water.

General Remarks

Salmon testes and calf thymus DNA were obtained from Sigma. Ligands **L1** – **L4**,¹ complex **Cu-L5**,² α,β -unsaturated 2-acyl imidazoles **1b**, **1c**, and **1e**,³ **1d**,⁴ were prepared following published procedures. ^1H -NMR and ^{13}C -NMR spectra were recorded on a Varian 400 (400 and 100 MHz), Varian 300 (300 and 75 MHz) or Varian 200 (200 and 50 MHz) in CDCl_3 . Chemical shifts (δ) are denoted in ppm using residual solvent peaks as internal standard ($\delta_{\text{C}} = 77.0$ and $\delta_{\text{H}} = 7.26$ for CDCl_3). Mass spectra (HRMS) were recorded on an AEI MS-902. Optical rotations were measured on a Schmidt and Haensch Polartronic MH8. FT-IR spectra were measured on a PerkinElmer Spectrum 400 equipped with a PerkinElmer liquid sipper sampling accessory, and a 0.1 mm path length cell. Enantiomeric excess determinations were performed by HPLC analysis using UV-detection. Reactions were followed in time by HPLC and RP-HPLC analysis using caffeine as an internal standard and UV-detection. Flash chromatography was performed using silica gel 60 Å (Merck, 200-400 mesh).
