Chapter 4: Content, context and co-creation: a content analysis of tourism-oriented online publications in which the tourism potential of Portugal and its northern region (NUTS II) has been discussed

Chapter overview
Content generated by tourists, travellers, professional travel bloggers and travel journalists who post, comment and share information on social media channels is arguably the greatest digital challenge of destination branding today. The tourist-/traveller-generated content is likely to generate brand value if integrated into the destination branding strategy. There is, however, a lack of theoretical awareness and empirical research into the role of social media content in shaping destination brands in particular and place brands in general. By taking Portugal and its northern region as a case study, this exploratory research is aimed to show how content analysis can be used to identify and understand the way tourists and travellers perceive the country and the region as a tourist destination. The application of this methodology on online material could contribute to a refined destination branding initiative at the national and regional levels by integrating user-generated and travel experts content into the place branding strategy. This chapter follows the methodology of this thesis, and applies textual content analysis by using qualitative data analysis software (that is, ATLAS.ti 7.0), within an interpretative paradigm, on tourism-oriented online publications in which the tourism potential of Portugal and the northern region has been discussed. The findings highlight the tourist/traveller as an opinion maker with access to a plethora of information communication technologies to act as co-creators of place brands. Therefore, it is wise to engage them and strategically integrate the content they generate into the whole place (national/regional) branding effort.

4.1. Introduction
Technological advances and the rise of the empowered tourist/traveller suggest that in the future the most successful destinations will be those that abandon the traditional top-down approach in favour of bottom-up and co-created branding strategies. Therefore, a simple tourist or traveller is an active creator of the destination brand. Developments on the Internet and social media have allowed the acquisition of immeasurable amounts of information, from landscape descriptions to pricing, accommodation rating and also scandals with influence on the image of destinations (Moutinho et al., 2013). It is widely accepted that digital destination branding has become more complex and challenging (Munro and Richards, 2011).

Travellers and tourists, of all ages, increasingly use digital technologies to research, explore, interact, plan, book and ultimately share their travel experiences. There is an extensive array of online channels available to use for this purpose (for example blogs, weblogs, virtual communities and social networking sites). These channels, together with the shift towards traveller empowerment, are demanding new strategies in destination branding initiatives. According to Pan, MacLaurin and Crott (2007), the impact of word of mouth on tourists’/travellers’ decision-making process is uncertain and needs to be investigated through new methods. In addition, digital communities and the
Traveller-generated contents are creating great opportunities to unobtrusively obtain data to investigate the realm of tourists’/travellers’ experiences and sentiments (Volo, 2010).

Travellers, tourists and visitors have the possibility to quickly generate content regarding their travel and vacation experiences and spread it in the blink of an eye. A destination brand conveyed by a destination marketing organization (DMO) is likely to engage in a two-way conversation. Likewise, networked platforms have changed the interface between destinations, their brands and visitors. In fact, it is no longer the traditional vacation marketing mix that dictates the promotion rules; it is now the tourist consumer and the traveller who control the content, influence the context and determine what is communicated about a particular destination (Yeoman and McMahon-Beatie, 2011). The traveller has taken the driving seat in brand identity (Green, 2007). Given these facts, DMOs, such as Visit Portugal and Regional Entity of Tourism of Porto and Northern Portugal, would achieve better results (for example increase the number of visitors and tourist revenues) by using coherent strategies to engage with (potential) visitors through the multiple online channels available. In addition, the Internet and social media platforms are the optimal platforms to spread a narrative, a story and a message. The common citizen that becomes tourist/traveller for a period of time and then becomes non-professional/professional travel bloggers and travel journalists who are no longer mere information seekers but co-creators of information, generating opportunities for them to conveniently share content despite being separated by sociocultural differences and geographical distances (Volo, 2010). Among a range of social media platforms, travel blogs are becoming a more important mechanism for exchanging information among tourists and for destinations and businesses to learn about the attitudes of their markets (Wenger, 2007). Accessing these freely written libraries of content, therefore, represents an occasion for strategic tourism planners to look at the tourist/traveller in his/her natural mental environment and to explore their experiences.

In today’s competitive environment, in which visitors can only be attracted by unique attractions (Eriksson, 2013), it is a challenge to improve destination’s features, attributes and unique elements to become attractive places to visit (Alvarez, 2012). Innovation, decentralization, engagement, involvement and having a unique voice are the keywords for successful destination branding. In addition, destination brands to survive in a savvy environment, where tourists/travellers are literate individuals, branding strategies should fit their desires (Moutinho et al., 2013). However, it is not an easy task to assert strategies with divergent narratives produced on the same destination. Thus, a challenge remains – how should destinations respond to it? This subject has been covered at length by Destination Marketing Association International and others, but the academic literature remains unclear. According to Reilly (1990), the focus of tourism-image research has been understandably pragmatic and marketing based and requests new thinking in tourism planning and destination management.

Tourism planners, destination managers as well as strategic spatial planners now have the opportunity to connect with customers at many more communications and experience touch points than ever before to influence visitor satisfaction, loyalty and word of mouth (for example by social media). The digital world is truly interconnected, interlocked and interpersonal. It allows disparate items – ads, articles and social experiments – to converge on one page as if they were magic. A destination brand can be defined as the sum of all narratives and experiences. But who defines them?
Are there any inequalities in sharing content (for example by gender)? To what extent gender influences the design of destination branding strategies for example? There are power relations that should be carefully analysed. Destinations are socially constructed and the content produced by travellers is only a part of that process. The better response is to use real-life stories and engage with the content by identifying and interpreting patterns across the narratives in order to achieve consistency in brand positioning.

According to Young (1999), tourist destinations are socially constructed and a negotiated phenomenon. However, the question of how places are socially produced and consumed lies at the core of the geography of tourism (Young, 1999). The social construction of tourist destinations consists of two general subsystems. The first is place production by the tourist industry. In this context, place producers communicate place meanings through promotional, interpretative and market research strategies. The second subsystem is place consumption, which refers to the tourists’ own construction of place. Tourists create place meanings using their actual knowledge, travel history, motivations and preferences. Where the constructions overlap, there exists the negotiated reality of the consensus zone. Which places are selected to be branded for tourism purposes, how and why they are given particular meanings and how these meanings are communicated to create convergence between these two perspectives of place are key aspects of the spatial dimension of social construction (Young, 1999).

The notion of perceived authenticity is also of particular interest because constructivists, tourists and travellers are indeed in search of authenticity (Wang, 1999). However, what they quest for is not objective authenticity (that is, authenticity as originals) but a perceived authenticity which is the result of social construction. Destinations and the ‘tourist attractions’ are experienced as authentic not because they are originals or reality, but because they are perceived as the signs or symbols of authenticity (Culler, 1981) nowadays influenced by digital platforms. Perceived authenticity is more often than not a projection of certain stereotyped images held and circulated within tourist promotion platforms, particularly within the mass media and destination marketing campaigns (Wang, 1999). Understanding exactly how individuals perceive and use the information spread by both online and traditional promotion channels when planning their trips is a challenge that requires suitable strategies (Alvarez and Asugman, 2006). By not understanding it, there is the risk of damaging the perceived integrity and transparency of the destination’s brand and reputation (Munro and Richards, 2011).

The accelerating and synergistic interaction between information communication technologies (ICTs) and tourism destinations has transformed the nature of tourism products, processes, business and the competitive environment around them. Among the range of ICTs, the Internet is the number one source of information for travel and tourism (Munro and Richards, 2011). Websites are incredibly important for the business of destinations (Buhalis et al., 2011). Factors including a fresh wave of web-based communities, known as web 2.0 and social media (for example Facebook, Twitter, Instagram, You- Tube and TripAdvisor), have changed market conditions for DMOs (Buhalis et al., 2011; Page, 2009). Furthermore, social media has become a highly effective way to reach out and engage with the masses. In particular, social media allows a DMO to develop an online voice, which should be consistent with its destination brand (North, 2013a). Therefore, a resilient
and strategic approach to digital channels should be a corner stone of a strong destination branding strategy. Recent literature on tourism planning as Moutinho et al. (2013) and on place branding as Pareja-Eastway et al. (2013) suggest that organizations in charge of designing branding strategies shall concentrate their effort on:

- **Content**: focusing on the interaction between traveller/tourist and destination; engaging traveller/tourist with the destination branding process;
- **Context**: tailor-made approaches and context-sensitive strategies; integrate traveller-generated content;
- **Co-creation**: co-creating value through traveller/tourist and the destination; destination branding through co-creation (that is, traveller as active participant in the branding process).

Some studies reflect upon tourism communities (Wang et al., 2002), users’ reviews and recommendations (Yoo and Gretzel, 2008), electronic tourism (Buhalis et al., 2011), perceived authenticity (Wang, 1999), and others on social media strategies for tourism destinations (Munar et al., 2013) and ICTs in tourism destination management (Buhalis and Matloka, 2013; Leung et al., 2013). However, there remains a gap in knowledge which investigates the relevance of tourist/traveller-generated content on the destination branding process.

By taking Portugal and its northern region as a case study, this exploratory research is aimed to show how content analysis can be used to identify and understand the way tourists’/travellers’ perceive Portugal as a tourist destination. The application of this methodology on online material could better support a destination branding initiative for Portugal by integrating tourist-/traveller generated content (that is, narrative, stories and vacation experiences) and travel experts content into the strategy, thus, co-creating tourist destination branding strategies.

To this end, a qualitative methodology has been applied. The implication of qualitative methods emerged from the principal approach of this research to obtain in-depth understanding of how travellers perceive, interpret and communicate the social reality of the destination visited. An inductive approach was adopted to address the research aims that are subjective in nature and within an interpretative paradigm. According to Decrop (1999), interpretivism in tourism related studies is better approached by qualitative methods. The qualitative approach used in this exploratory research is in line with the methodology of various studies that focus on the meaning and understanding of destination image (Echtner and Ritchie, 2003; Govers et al., 2007; Pike, 2002 and Tasci and Kozak, 2006). In addition, embracing previous studies on virtual destination image (Govers et al., 2007), e-tourism (Buhalis et al., 2011), communication strategies and city marketing (Díaz-Luque, 2009; Munuiz-Martínez and Cervantes-Blanco, 2009), which mostly use qualitative techniques, are fundamental to enhancing arguments and justifying the present research methodology. Specifically, a textual content analysis was conducted on 20 international tourism-oriented online publications from distinct, distinctive and neutral sources, all referring to Portugal (as a whole or specific cities or regions of the country).
The articles/texts were examined and findings presented, aiming to capture holistic components of Portugal as a tourist destination. As the objective is to interpret the content of publications where Portugal and its northern region are reference, a content analysis will be a more valuable tool. Similar studies on destination image apply the same methodology (Volo, 2010; Wenger, 2007). The content analysis approach is a form of scientific inquiry that has commonly been regarded as a useful method for social science studies, especially in consumer research (Kassarjian, 1977). In addition, content analysis has been used in several studies to analyse research articles in hospitality and tourism management (see, for example, Singh et al., 2007).

The results from the content analysis of both the computer-aided and human judgmental methods were then integrated and conceptually graphed to map meaningful findings that were logically precise, humanly readable and computationally tractable (for example ATLAS.ti 7.0). The reason for using this software is twofold. One, because with today’s computerized neural network content analysis software such as CATPAC, NVivo 2.0 or ATLAS.ti, the reliability of the results is more guaranteed (see, for example, Govers et al., 2007). Second, according to Lewis (1998), ATLAS.ti emerged as the clear winner in the overall product comparison with other qualitative software such as NVivo 2.0.

ATLAS.ti is a self-organizing artificial neural network software package used for content analysis of text. The software is able to identify the most important words in a text and determine the patterns of similarity based on the way they are used in the text (Govers et al., 2007). In simple terms, this software produces a frequency table and proximity matrix for the most often used words in the text, based on their co-occurrences in one unit of analysis (Zull and Landmann, 2004). Even though it requires the researcher to use human judgment in making decisions about the data, the decisions must be guided by an explicit set of rules. The findings must have theoretical relevance and be generalized (Kolbe and Burnett, 1991).

The application of this methodology on online material could better support a destination branding strategy for Portugal by integrating tourist-/traveller-generated content and travel experts content into the strategy, as a back office task. In particular, it helps academics and practitioners to better understand a new, emerging phenomenon - the co-creation of place branding strategies. As such, the chapter will contribute to the interplay between theoretical awareness and methodological sophistication in the integration of digital channels, including traveller-generated content platforms. Bearing in mind the best practices in dealing with the changing digital landscape (for example Tourism Australia, Visit Sweden and Penang State Tourism in Malaysia), this study reflects on digital strategies to respond to the digital opportunities and threats in destination branding.

In the context of futuristic thinking in destination branding and future casting mega trends in tourism, it has been argued that the ever evolving channels of social media and the consumer shift represented by the new e-generation are now inevitable factors in destination planning (Moutinho et al., 2013). By 2013, social media engagement has become the top Internet activity, a higher time spend than any other major Internet activity (GWI - Global Web Index, 2014). Within this context, the main contribution of this chapter arises from the integration of social content analysis into destination branding strategy. The findings add to destination branding practice and advocate that DMOs, governmental agencies, regional entities, such as TPNP, or tourism agencies are requested to
co-create effective destination branding strategies to deal with the growing number of digital platforms, tools and devices and satisfy tourists’/travellers’ expectations.

4.2. Tourism and place branding for tourism purposes

Tourism has often been seen as a key element in the development of places, which are adopting branding strategies – meant to gain a competitive position and assert their identity – in their communication with potential tourists (Morgan et al., 2011). Branding is considered a powerful tool to develop places (Morgan et al., 2003). Cities such as Amsterdam (Kavaratzis and Ashworth, 2006), Manchester (Ward, 2000) and Bradford (Trueman et al., 2004) have already reinforced their image among visitors, investors, entrepreneurs, researchers and, desirably, among residents. Countries such as Thailand (Nuttavuthisit, 2007), Costa Rica, Moldova (Florek and Conejo, 2007), Ireland (O’Leary and Deegan, 2003) and Turkey (Kemming and Sandikci, 2007) have undergone the processes of destination branding and promoting a positive tourist-oriented image.

According to Buhalts (2000), a tourist destination is a “geographical region which is understood by its visitors as a unique entity, with political and legislative framework for tourism marketing and planning” (p. 98). Saarinen (2004) cited in Morgan et al. (2011, p. 4) interprets a tourism destination as “socioculturally produced space in a constantly evolving discursive practice”. Tourism images reflect people’s geographical imagination and contribute to the making of imaginative geographies, which refer to generally held ideas about particular places and regions. This representation of tourism destination is a fundamental part to define what a destination is. Narratives, discourse, tourist/traveller opinions changes through time, context, gender and cultural background. In order to be successfully promoted in the targeted markets, a destination must be favourably differentiated from its competitors, or positively positioned, in the minds of the consumers and potential visitors. A key component of this positioning process is the creation, management and communication of a distinctive and appealing image (Echtner and Ritchie, 2003). In addition, tourism destinations are inherently complex. A range of social, economic, legal and technological policies affect their appeal, attractiveness, competitiveness and sustainability (Brent-Ritchie and Crouch, 2011).

Destination branding is focused in lowering costs, changing the type of visitors and changing the nature or behaviour of visitors. Destination branding also plays a core role in changing tourism products, integrating place actors and communities, avoiding irritations and responding to issues posed to places. For instance, those issues are created by the present economic crisis or the fluctuating process of exploring, researching, confirming and sharing travel experiences. However, branding places is not a magical solution. Given the complex nature of destinations, it is rather difficult and time consuming to persuade visitors to change their perceptions about a destination. An extensive network that brings visitors and destinations closer to each other composes the technological environment. Ultimately, the goal is to engage visitors with destinations. It is also to create strategies for communicating assertively about the kinds of experiences potential visitors may expect. Setting out a destination branding strategy and integrating it with ICTs emerges with the need for coordination of frontend and back office applications (Muñiz-Martínez and Cervantes-Blanco, 2009). Place marketers, strategic spatial planners, tourism planners and DMOs play a major role in turning communities and cultures into tourism destinations.
There is also a case in which tourism destinations flourish without cultures, communities or identities (for example Las Vegas). The branding process of a destination requires a strong vision, focus and commitment of time. In addition, it also requires qualified human resources, engagement with stakeholders, financial resources and changes in decision-making, culture and mindset (Balakrishnan, 2009). The Internet and the social media channels have generated numerous online user (traveller/tourist) reviews. According to Ye et al. (2011), previous studies have revealed the influence of user-generated content on the sales of products. However, the influence of online user generated reviews in the tourism industry is still largely unknown to both tourism researchers and practitioners (Sigala, 2011; Ye et al., 2011). Therefore, there is a need for theoretical awareness and empirical research with regard to the role of the web 2.0, the empowerment of the traveller/tourist and the content they generate in shaping destination brands (Buhalis et al., 2011; Munar, 2011).

Besides the acknowledged value of the user-generated content in branding tourist destinations (Munar, 2011), the literature (Pareja-Eastway et al., 2013) suggests tailored branding strategies, which focus on local realities, assets, tangible and intangible elements. Context sensitive approaches, as opposite to one strategy fits all, are required to achieve effective, sustainable and long-term success in particular in times in which the digital realm is contributing to a borderless world.

### 4.3. Digital evolutions and place branding

With the growing importance of the Internet for travel planning, understanding the online domain of tourism is vital in order to identify the challenges and potential solutions for effectively branding travel destinations. Travellers seek inspiration online, anticipate more trips or holidays and want to stay connected while travelling. The Internet is now as essential for inspiring new travel as it is for planning them (Google Think, 2013). Moreover, the Internet has revolutionized the travel planning process. According to the Digital Portal of the European Travel Commission, nearly 183 million European Internet users visited travel websites in March 2013 (Travel Daily News, 2013) (Table 4.1).

**Table 4.1.** The methods used for booking by European travellers in 2013 compared with 2003.

<table>
<thead>
<tr>
<th>Methods</th>
<th>2003</th>
<th>2013</th>
</tr>
</thead>
<tbody>
<tr>

<td>65%</td>
<td>18%</td>
</tr>
<tr>
<td>Telephone</td>
<td>22%</td>
<td>5%</td>
</tr>
</tbody>
</table>

According to the survey Attitudes of Europeans Towards Tourism (European Commission, 2013), the most frequently used sources of information for trip planning are:
(1) recommendations from friends, colleagues or relatives: 56 per cent;
(2) internet websites: 46 per cent;
(3) personal experience about a destination: 34 per cent;
(4) travel agencies and tourism offices: 21 per cent;
(5) tourism brochures and catalogues: 11 per cent.

The lower values of the more traditional mechanisms to plan holidays, such as travel agencies and tourism offices (21 per cent) and catalogues (11 per cent), clearly highlight the increasing digital challenges in destination branding. Digital revolutions are demanding conceptual, methodological and strategic evolutions on destination branding (Morgan et al., 2011). According to Balakrishnan (2009), managing a destination’s international image and reputation requires strategies capable of leaving a clear and unique image in the minds of tourists. The messages should be consistent across all digital media channels.

Moreover, travellers are now socially connected during the entire travelling spectrum. Moutinho et al. (2013, p. 317) refer to it as “New Socio quake”. In response, Javier González-Soria has underlined that the tourism industry should use social media much more intensively (see ITB World Travel Trends Report, 2013). In addition, the travel industry has to respond honestly and transparently to problems or criticism regarding their assets, values and tourism potential – where tourists should be active participants, not passive audience (Moutinho et al., 2013). Integrating the content they generate into the process is actively engaging them with the branding process of a destination (for example city, region and country).

Tailor-made and context-sensitive approaches to place branding, for instance for tourist destinations (Moutinho et al., 2013; Pareja-Eastway et al., 2013), integration between online tourist-/traveller-generated content and branding strategies, the core points of this chapter, bring novelty to the literature on place branding by exploring co-creation of place brands. Furthermore, virtual communities, blogs, social networking sites and tourism review pages give a platform for online opinion leaders from anywhere across the globe express their opinions. As a consequence, they influence the public realm and co-create destination brands (Moutinho et al., 2013). The traveller is now empowered to create and tailor the brand themselves; it is the traveller who now won the brand (Moutinho et al., 2013).

4.4. Digital trends, technologies and best practices in place branding for tourism purposes

DMOs and governmental entities, such as Visit Portugal or TPNP, encounter tough international competition and so the adoption of information communication technologies in branding processes has become a strategic imperative.

Every country, city and region offers a certain package of tourism products, some integrated into a destination brand, others only communicated through promotional material. Because of this, the tourism activity has become saturated with choice. Given these facts, there is pressure for destination branding to focus on applying the right set of digital tools rather than the technicalities of the tools themselves.
Internet, websites and social media have now become mainstream in the tourism industry (Digital Tourism Think Tank, 2013). Furthermore, the ITB World Travel Trends Report (2013) states that social media platforms such as Facebook, Twitter and YouTube, in recent years, are increasingly being used for travel and tourism purposes. Travellers are using ICTs to exchange pictures and videos from past vacation experiences; to share ideas about possible holiday trips and to seek opinions and reviews of destinations, hotels, attractions and countless other travel-related activities (Buhalis and Matloka, 2013). The ITB World Travel Trends (2013) reports that:

- 40 per cent of travellers said social network comments influenced their travel planning;
- 50 per cent actually based their travel plans on other people’s reviews and experiences. The European Digital Landscape (2014) reports that:
  - The average European social media penetration is 40 per cent (considerably higher than the world average);
  - Portugal, with 48 per cent is one those 21 European countries with a higher than average social media penetration rate.

A considerable number of DMOs consider social media either as the key ingredient to their destination strategy or at least as one of their main digital tools. In reality, if the tourism website of a destination does not display the territory or destination brand, but instead uses the brand of the promotional agency or DMO, it may reflect the fact that the destination brand needs further development (Roig et al., 2010). Among the tools to measure the performance of country brands, the Bloom Consulting Country Brand Ranking (Bloom Consulting, 2013) provides insights into how countries use social media to interact with the public. However, DMOs are aware of the values and advantages of using social media (together with websites and weblogs) to promote their assets, distinctive competency and address challenges that result in achieving strategic performance objectives. One of the best examples in the world that harnessed the power of Facebook and Instagram to engage with a global audience is Tourism Australia (North, 2013a).

Tourism Australia has one of the most popular destination pages in the world (O’Neill, 2013). Their Facebook page has approximately 7 million “likes” (information updated on 22 October 2015, see https://www.facebook.com/SeeAustralia). The use of social media by Tourism Australia DMO strengthens Australia’s nation brand and promotes the country as a tourism destination. Portugal could learn from the Tourism Australia digital dynamic in giving visibility to their tourism potential, in particular the way it engages with the traveller.

Visit Sweden conducted another concrete case of how a DMO can successfully handle digital challenges in destination branding. Visit Sweden started a frenetic and innovative campaign on Twitter – I’Sweden (followed by approximately 87,000 users; information updated on 22 October 2015, see https://twitter.com/sweden). The aim of the campaign was to present Sweden to the world as well as strengthening the nation’s brand and hopefully, as increasing tourism revenues (North, 2013b). Visit Sweden handled its national Twitter account by selecting a different Swede every week to curate the Twitter feed by tweeting their thoughts to the world. The Curators of
Sweden campaign sought to prove this and reinforce it by being ultra-progressive on Twitter (North, 2013b). Portugal could also learn from these two examples, taken as best practices in integrating user-generated content and dealing with digital challenges in the branding process. The way both breakthrough digital channels could inspire Visit Portugal to craft a destination branding strategy to put together the voices of visitors, the content generated by travel bloggers, normal tourist/travellers, shared through social media (for example https://www.facebook.com/Visitportugal, https://twitter.com/PortoeNortePT and https://www.facebook.com/InsidePortugalTravel), the objectives of tourism actors and the goals of the organization (Oliveira, 2013a; 2013b; 2013c).

4.5. Using hashtags in place branding

Nowadays, there is a kaleidoscope of mobile applications and start-ups, which are making waves in the travel industry and developing a smarter way of travelling (Way and Scoble, 2013). Many major DMOs now have Twitter accounts to communicate and promote their destination. Some of them create hashtags to promote specific events, campaigns or the destination brand itself (Oliveira, 2013c). The use of hashtags on social media channels often increases the influence of content (making it public). Hashtags are those short links preceded by the sign - #. They are used to mark keywords or topics (for example #visitportugal #visitnorthernportugal and #heritage). A destination should create their one set of hashtags (Hiscott, 2013).

The hashtag was created organically by Twitter users as a way to categorize messages. Now it is also linked to content on Facebook, Google+ and Tumblr and is an extremely powerful tool on Instagram and Pinterest (photo-sharing tools). Hashtags are integral to the way we communicate online, and it is important to know how to use them (Hiscott, 2013). Clicking on a hashtagged word in any tweet, message, photo or post shows all other tweets, messages, photos or posts marked with that keyword from all around the world. In seconds, they become a piece of knowledge on the global sphere. The Malaysian Penang State Tourism - Twitter account (followed by approximately 12,000 users; information updated on 22 October 2015, see https://twitter.com/VisitPenang) and Visit Penang Instagram feed (followed by approximately 7000 users; information updated on 22 October 2015, see https://instagram.com/visitpenang/). In both accounts, it is possible to follow similar content by clicking on the hashtagged word (for example #georgetown and #penang). This action will open another page with all the pictures and tweets marked as #penang. Penang State Tourism is the tourism organization of the Malaysian island state with the same name. The authors use Penang State Tourism as an example, because recent research demonstrates that Penang Tourism DMO is more active among the DMOs using Instagram connected to Twitter and it allows interaction with the traveller. In addition, Malaysia ranks among the top 10 world tourist destinations in terms of international tourist arrivals (United Nations World Tourism Organisation, 2013).

DMOs already acknowledge that social media tools are no longer in their embryonic stages and therefore (potential) visitors need to be supplied coherently with relevant material on these channels. This in turn requires digital strategies. The way Penang State Tourism uses hashtagged words, to communicate content, works as a best practice for the Portuguese branding process and destination branding. A hashtag used successfully across channels is a marketer’s and tourism planner’s dream. If used well, an offline campaign can be tracked using the online platforms that make digital branding
strategies so compelling. Hashtags increase the relevance of electronic word of mouth and are a
valuable tool to share tastes (for example #delicious #portuguesecuisine), attitudes (that is, #inlove
with #sunnyportugal) and experiences (that is, had great #holidays in #southportugal). Moutinho et
al. (2013) argue that those persons, who share tastes and attitudes, are the only trustworthy source
of information in the “new e-generation” of the tourism sector (2013, p. 318).

4.6. The need for a digital strategy in place branding
The growing competition in the global marketplace puts, on one hand, intense pressure on tourism
destinations to guarantee long-term economic success as well as sustainability (Kastenholz et al.,
2013). On the other hand, the complexity of the destination branding exercise requires digital
strategies to face the advancement of digital and online technologies. The digital atmosphere
provides extraordinary levels of direct engagement of travellers with one another (Kavaratzis, 2012).
Travellers can now create content that can influence future visits to a destination. Taking an
Instagram picture of one destination asset (for example Cais da Ribeira, in Porto, northern Portugal,
by focusing on the case of this study or the Petrona Towers in Kuala Lumpur, Malaysia) and sharing
it via social media has changed the way the world accesses destination information.

Traveller-generated content affects the way a destination is communicated to the outside and
inside territory alike. According to Florek (2011, p. 83), “web 2.0 provides services that invite users
to engage in direct and strong participation” and “with the advent of user-generated content, every
individual might potentially influence the way in which [a territory] is perceived and evaluated”.
Therefore, implementing digital strategic thinking in destination branding is paramount. Digital
channels provide forums for travellers to discuss the places they have visited, write about travel
experiences and upload photos and videos. The travel experience starts with a dream. Potential
visitors will use the Internet to plan and book their vacation. Afterwards, they will share their
thoughts and feelings by using online means. The new luxury in tourism is not related to wealth but
the use of time, simplicity and richness of experience that create long lasting memories (Moutinho et
al., 2013).

In practice, a digital strategy should integrate traveller-generated content into the destination
branding process and thinking in advance the right tools to engage with it (that is, digital branding
strategic thinking). Destination branding experts could work in an integrative way with social media
and electronic tourism experts in a coherent way, maintaining communities of interest, collecting
content, displaying photos and videos, emphasizing local events, and encouraging electronic word of
mouth (eWOM) recommendations. Understanding that content, qualitative and diverse information
are the key to successful destination brand should be a key part of any destination branding strategy.

A destination brand is likely to be more effective if it is part of the destination’s overall branding
effort and that is much more than creating a logo, a tag line or opening a social media page (Díaz-
Luque, 2009). The process should consider the community’s needs, staying clearly focused on
community objectives. In addition, engaging with place actors and building the destination brand
with them in an active and participatory way will positively benefit the process. Communication of
the brand image consistently and coherently with the strategy is fundamental to maintain and/or
improve the brand reputation and give visibility to the place/destination (Munro and Richards,
The place/destination brand reputation should be moulded by dialogue and branding strategies crafted (see Mintzberg, 1987) to the social and spatial context. If the DMO involves the visitors, they will be more likely to keep the message in mind, talk about with their friends and relatives and spread it around the world using online channels. Travellers become co-creators of the brand (Moutinho et al., 2013). However, the authors acknowledge the difficulties of managing collective online opinion and discourse (that is, generated content) and how to engage across the variety of channels in an integrated way (that is, tools in strategy). Organizations in charge of a destination brand are recommended to eavesdrop on all the information/content created/generated by tourists/travellers. Researching with effective methodology and understanding how the destination is perceived and communicated will provide compelling, timely and relevant paths to a successful destination branding strategy.

4.7. Research methodology

4.7.1. Justifying the qualitative approach employed

Tourist destinations are not ontologically pre-given but, instead, socially constructed (Saarinen, 2004 cited in Morgan et al., 2011). Therefore, one could argue on the relevance of using qualitative methods to understand how destinations are socially constructed as well as the relevance of co-creation in place branding. And yet, the investigation highlights that tourist destinations do not constitute a structure of ontologically pre-arranged places but rather are the outcome of ongoing narratives among tourist/traveller through which content is constantly reproduced and nurtured during the branding process. The epistemological assumptions in these instances determine extreme positions on the issue of whether knowledge/content is something which can be acquired on the one hand or is something which has to be personally experienced on the other. How we come to know tourist destinations? Is it about reading and interpreting content generated by tourists/travellers or by experiencing them? In addition, how to integrate this knowledge into the destination branding strategy? Bearing these ontological and epistemological assumptions, this study employs a qualitative framework within an interpretative paradigm.

Qualitative research has gained acceptance in many fields, such as education, anthropology, and consumer behaviour (Riley and Love, 2000). Qualitative research is often qualified as bricolage or art, in contrast with quantitative research. If one accepts the principle that science is not a question of numbers but of reasoning, a qualitative study can be as sound as a quantitative one in tourism studies (Riley, 1996). However, studies that employ qualitative methods in tourism research and assessing destination image are rare (Govers et al., 2007). Those studies lack a deeper understanding of the holistic nature and subjective perspective of the individual, not the destination’s unique image features (Echtner and Ritchie, 2003; Govers et al., 2007).

Being a timely and dynamic issue, the digital challenge in place/destination branding requires pluralistic approaches as liking the two seems fundamental to assert the rapid expansion of online channels dedicated to travel and tourism with the branding process of places. According to McDougall and Fry (1974), the use of unstructured instruments, followed by content analysis and coding, is more appropriate in image research. Further in time, Echtner and Ritchie (2003) suggest a combination of structured and unstructured methodologies to measure destination image through
travellers’ narratives. Recently, an increasing number of researchers in tourism studies (see Hannam and Knox, 2005), hospitality (see Singh et al., 2007) and destination image online (see Govers and Go, 2004; Govers et al., 2007; Hsu and Song, 2013) are using specific research methods that are often conveniently grouped together under the term discourse analysis, for instance, text mining and content analysis when faced with qualitative or textual forms of data, such as written documents (for example strategic spatial plans; policy documents as in chapter 3) or visual materials (for example photographs; videos; instagrams) (see, for example, Hannam and Knox, 2005; Singh et al., 2007). Despite that content analysis is not a new technique it stills very useful in the analysis of written documents including online material. The authors have applied this technique to prepare chapters 3, 4, 5 and 6 of this thesis.

Following the application of qualitative methods (see, for example, Tasci and Kozak, 2006) and analysis in tourist destination studies (see, for example, Govers and Go, 2004; Govers et al., 2007) and bearing in mind the complexity of the digital challenge, the novelty of this research lies in the application of content analysis of written signs/text (Dann, 1996) from tourism-oriented online publications. The advantages of applying this methodology, is that by using the right qualitative research software, and coding (for example ATLAS.ti), the process of getting the information is easier, faster and dynamic. Moreover, it allows researchers and tourism organizations/DMOs (data seekers) to keep up to date their studies and reports. Daily, the World Wide Web publishes information relevant to keeping higher levels of dynamism in destination branding exercises (generated content) and also to fit, sharply, the experiences offered with the tourist expectations and needs and get the message across.

4.7.2. Content analysis of tourism-oriented online publications

Content analysis is an empirical technique, which involves the counting, identification of issues and interpretation of the content of a text, which is assumed to be significant (Hannam and Knox, 2005). Content analysis calls for the categorization of the various elements or components to help researchers explain trends (Kassarjian, 1977; Krippendorff, 2003). The argument here is that content analysis is suited to contribute to a better understanding of the paths for effective and reliable branding strategies for Portugal as a tourist destination. Several authors were pioneers in the research topic of travel blogs and other free tourism-oriented online publications. Moreover, they have published research that actually analysed content written by traveller bloggers (Pan et al., 2007; Pudliner, 2007; Tussyadiah and Fesenmaier, 2008; Volo, 2009; Wenger, 2007; Woodside et al., 2007).

The research of the abovementioned authors is very valuable in insights about traveller-generated content and shows potential power in the co-creation of brands (Volo, 2010). For instance, Pan et al. (2007) analyse 40 travel blogs on South Carolina, USA, using a combination of semantic network analysis and content analysis. Recent studies that intended to investigate online channels’ usage and social media involvement to promote Portugal as a tourism destination, content analysis has been applied on online newspaper (Oliveira, 2013a, 2013b). The present chapter explains further the application of this methodology in travel blogs and travel review pages with references to Portugal as tourist destination.
4.7.3. Content analysis with references to Portugal and northern Portugal as tourist destination

By taking Portugal and its regions, in particular northern Portugal region, as a case study, this exploratory research applies a textual content analysis on 20 tourism-oriented online publications in which Portugal (and Portuguese territories) has/have been referenced.

The selection followed the author's own decision, after careful analysis of the links shared on the official Facebook page of the Portuguese National Tourist Office in New York, USA – Inside Portugal Travel (https://www.facebook.com/InsidePortugalTravel) with support from Visit Portugal. The content analysis was conducted on 20 relevant articles published between 1 September 2013, and 20 February 2014, in specific websites (Table 4.2.). Out of 20, 14 texts constitute the sample that has been analysed within and interpretative stance.

The text of the 20 publications was content analysed and research findings are presented (Table 4.3.). The software ATLAS.ti 7.0 was used. ATLAS.ti is designed to offer qualitative-oriented social researchers support for their activities involving the interpretation of signs (written and visual). One very early and important design decision was to leave creative, intellectual tasks with the human interpreter. The tool WordCruncher was applied to set out the frequency of words (that supports the interpretation of the content, context and co-creation and to identify potential hashtags and suggesting tools; Table 4.3.). Content generated by travel bloggers and tourism reviewers was analysed and potential relevant elements to integrate a destination brand for Portugal identified.

Table 4.2. List of online articles content analysed September 2013 - February 2014.

4.8. Research findings
Table 4.3 summarizes the findings of the textual content analysis. Particular emphasis is given to the tourist-/traveller-generated content (content column). The context refers to the geographical unit referred in the publication and the tourist product emphasized. As underlined in the introductory part and literature review, the content generated by the tourist/traveller could support a design of effective and efficient destination branding strategies (that is, co-creation of the brand) and boost existing tourist products of Portugal. The authors also highlight the words that could be “hashtagged” and communicated via digital channels, such as Twitter, Facebook or other social networking sites and mobile apps, drones and digital kiosk (that is, tools). Subjectivity and personal creativity based on the literature and previous research (see Oliveira, 2013c) supports the hashtag/tools suggestions/recommendations (Table 4.3).

Table 4.3. Research findings for 14 of the 20 online articles content analysed (grey colour highlights the reference to northern Portugal).

### 4.9. Discussion and reflections

This study content analysed 20 publications and presented detailed digital strategies to deal with 14 that could inspire Visit Portugal and the Regional Entity of Tourism of Porto and Northern Portugal. But is Visit Portugal - the national tourism authority - or the Regional Entity of Tourism of Porto and Northern Portugal - integrating content generated by travel bloggers, travel journalists and normal visitors into their campaigns or strategies? The literature highlights that it is wise to engage travellers and strategically integrate the content they generate into the whole destination branding effort (Wang et al., 2002). In addition to the analysis of the content of the mentioned 20 links, the
authors follow Visit Portugal official Facebook page (https://www.facebook.com/Visitportugal) and Visit Portugal official Twitter account https://twitter.com/visitportugal, and the authors have noticed a permanent sharing of the mentioned links and the application of hashtags in key content. In addition, there is consistency between sources and both, and the Facebook page and Twitter account keep the same layout and the content is shared simultaneously.

There is a considerable interaction after posting one of the analysed weblogs (Table 4.2.) and the “normal/average visitor”, which is the biggest challenge in destination branding in today’s digital environment. Discussing the findings (Tables 4.2. and 4.3.), which could inspire Visit Portugal and generally other DMOs, the main cities of the country were identified more frequently and their tourism potential revealed (that is, Porto, Lisbon, Coimbra and Braga). However, cities as Braga (post number 8), Sintra (posts 8 and 14) and Madeira (posts 6, 7 and 8) and Azores Island (posts 4, 7 and 8) also deserve special comments from bloggers and reviewers.

The Portuguese gastronomy and the variety of wines, such as Port Wine, White Wine and Madeira Wine are often described for its excellence and quality (but are they part of the national strategy for tourism? – chapter 6 will provide some clarifications on this matter). Wines are a highly competitive field and in case of the Portuguese wines one of the main challenges is that they are too well known but in a limited range. For example, Port and Madeira Wine have strong brands, especially in UK, but only for a limited range of wines. The recent achievements of Porto as the best European destination 2013 (see post 10, Table 4.2., page 14) was several times reported and links shared (with large engagement through Facebook likes and Twitter retweets). At this point, it is also fundamental to underline that those publications, shared through a web link, facilitate sharing platforms where the reader can also spread the content through their one social network (the e-word-of-mouth effect).

The posting and sharing processes value traveller/tourism content, despite the fact that Visit Portugal can develop this exercise by applying content analysis (in a larger scale than in this chapter) and taking the content as the heart of the destination branding process. The traveller generated content supports targeting niche markets and the co-creation of the brand. Although ICTs and the content shared throughout the Internet are not necessarily a source of sustainable competitive advantage, its integration into tourism organizations is one of the key to success as discussed in Gretzel et al. (2000) cited in Buhalis and Matloka (2013).

The research findings have shown that the content generated by those who interact with destination Portugal belong either to professional bloggers or to “normal/average visitors”. Content analysis can be used to identify and understand the way tourists/travellers perceive Portugal/northern Portugal as tourist destinations. Tourists/travellers are opinion makers and storytellers with access to a plethora of information communication technologies to act as co-creators of brands (for example weblogs, blogs, virtual communities and social networking sites). Tourists and travellers are the new architects/creators of the destination brand. Therefore, it is recommended that the tourism sector takes a much more active role in engaging with them, for instance analysing their perceived emotions, desires or past experiences, and facilitating platforms upon which tailored, context sensitive and co-created offering can be developed (Moutinho et al., 2013).
As the main contribution of this chapter goes to Visit Portugal and Regional Entity of Tourism of Porto and Northern Portugal, they are recommended to look on the Internet to find the backbone for a potential destination brand to position Portugal as tourist destination. Tables 4.2. and 4.3. show only a small part of a large number of publications where Portugal was mentioned. It means that travellers who experience Portugal are generating content about it. The DMO Visit Portugal and the Regional Entity of Tourism of Porto and Northern Portugal, can embrace their narratives, comments, opinions, suggestions, positive and negative aspects in favour of a strong, effective and customized brand. Although those narratives can contradict the National Strategic Plan for Tourism 2013-2015 (Tourism of Portugal, 2012), the Internet offers dynamic tools for tailored programmes and products.

Overall, the findings provide a preliminary foundation for future research to investigate how travel websites, travel blogs and tourist experts refer to Portugal as a tourism destination. Content analysis attempts to reach a better understanding of which products are enhanced and to compare with the national tourism strategy.

4.10. Conclusions
4.10.1. What image is coming across about Portugal, in comparison with other places?
This chapter allows me to emphasise the confusing image of gastronomy, wine, beaches and cities Portugal holds. In addition is not clear the image associated to northern Portugal. One can conclude that the image of the country and the region are weak and have multiple focuses. A regional branding strategy has to work with that reality and to shape the image and contribute to make it more strong, consistent and accurate. Is important to relay on the content generated by average/non-professional travellers, professional traveller bloggers and travel journalists who post, comment and share information in social media channels – they are co-creators of place brands.

4.10.2. Content generated by average/non-professional travellers, professional traveller bloggers and travel journalists in a regional branding strategy: final remarks
Content generated by average/non-professional travellers, professional traveller bloggers and travel journalists who post or comment and share information in social media channels is the biggest digital challenge posed to the branding process of destinations, as the authors have argued following the literature.

This chapter concludes that tourist/traveller-generated content could support the design of a destination branding for places, such as Portugal or northern Portugal as tourist destinations. With the economic and financial breakdown, tourism destinations, as Portugal, have less funding for luxury in destination branding and further sophisticated online marketing campaigns. Tourism-oriented publications are all around and free. Therefore, tourism organizations can build their online presence through social media where they are invited to present themselves to an audience without costs. Tourism Australia and Visit Sweden are doing it well, as exemplified. The ultimate goal is to meet travellers’ expectations (that is, before, during and after the visit), travellers’ experiences, including experiences from expert travellers (for example travel bloggers and travel journalists) and the content/narratives they have generated.
Efficient destination branding depends upon a strong, visionary leadership, a brand-oriented organizational culture, compatible partnerships, departmental coordination and process alignment. Coherent communication with the destination stakeholders is vital. The digital domain has emphasized the co-creational process of territorial brands in general and, at the same time, made participation in this process more freely available and more desirable. Moreover, ICTs give DMOs the tools to facilitate a virtual dialogue between residents and tourists before they arrive in and after their departure from the destination. Pre and after-trip interactions enrich tourists’ virtual experience, enhance their destination image through strong virtual presence and cultivate their loyalty toward the destination. This is where DMOs must play a more active role in designing, facilitating and monitoring experiences across destination participants and touch points.

This chapter, however, concludes that instead of extending their brand communications to the World Wide Web by simply digitizing the logos, tag lines and other elements, tourism destinations, including Portugal, can build consistent place branding strategies, for instance at the regional level, digitally in an Internet-mediated environment where virtual experience takes place. Co-created place/destination brands are the future successful stories. Tourists and travellers can be animated to co-create the brand content and support the destination branding process (the content of the final output will be the result of the content generated by travellers and interested public opinion). This in turn increases the chances that consumers will share the content with their own social networks – the high-tech traveller will only respond to trustworthy, perceived as authentic brands, thereby increasing the reach and visibility of the destination brand, which Visit Portugal has been doing it.

This research, the methodology employed, opens up new perspectives on the digital challenges in destination branding trends that could warrant future conceptual inquiries and empirical investigations. It sheds some light on digital strategic thinking on destination branding literature, with particular focus on Portugal. This chapter is a pioneer in applying content analysis to integrate content, engage travellers and co-create brands for places. However, as future research the number of webpages and weblogs should be extended. In addition, future research could also employ in-depth interviewing or focus groups with destination marketers and managers on how to integrate the results of social media content analysis on their destination branding exercises. Another real future challenge is not so much about the gathering of data from wider and wider sources, like in this chapter, but knowing what to do with such data once we have it. For instance, update policy documents, strategic initiatives or design place branding initiatives aligned with strategic spatial planning goals in which tourism emerge as a strategic domain.

The next chapter (chapter 5) critically explores the role of place branding, specifically at the regional scale (specifically northern Portugal region), as an instrument for the attainment of strategic spatial planning goals. It also aims to contribute to the academic debate on regional branding by discussing its relevance and effectiveness in supporting economic and social spatial realignment through civic participation/civic engagement and the shaping of clearly envisioned agreed futures.
