geboren op 28 oktober 1961
te Assen
Promotor: Prof. dr. W.K. Klein Haneveld
Referent: Dr. L. Stougie
Preface

This thesis reflects the main part of my work during the four years I worked at the Department of Econometrics of the University of Groningen. The National Operations Research Network in the Netherlands (LNMB) is gratefully acknowledged for financing this position.

Looking back, the recent past is maybe best characterized by the term ‘global optimization’. First of all, it refers to the excellent work of my supervisors Wim Klein Haneveld and Leen Stougie, who skillfully removed constraints of many kinds that threatened to obstruct my work. I am grateful for the personal relationships that we developed.

Secondly, during this period I obtained the opportunity to make contact with the international research community working on stochastic programming and related fields. In particular, I mention the cooperation with Rüdiger Schultz, which I am pleased to know will continue for some time to come. I am especially indebted to the members of my committee: Professors Jan Karel Lenstra, Werner Rönisch, Caspar Schweigman, and Roger Wets.

In the third place, in global optimization it is acceptable, if not necessary, to settle for sub-optimal outcomes of a search procedure that is often disrupted because of a time constraint. Therefore, the analogy makes it easier to accept the fact that the results reported in this thesis are sub-optimal and incomplete.

I thank my former colleagues for providing such a pleasant working environment. To a large extent this is due to Daan Brand, with whom I shared a working room. His friendly attitude and wide interest and knowledge made it a pleasure to work there. Jointly with Wietse Dol and Erik Frambach I initiated what is now called the $4\text{PrX}$ workbench. Due to their enormous efforts this computer program is nowadays widely used and appreciated. I do not know if the amount of time that I saved by using $4\text{PrX}$ to write this thesis compensates for the hours that I invested in developing it. Anyway, the joy of working together made it well-worth.

Lies Huizenga and Evert Schoorl of the Graduate School / Research Institute Systems, Organisations and Management have been very helpful in arranging many practical things. The publication of this thesis is financed by SOM.

Finally, I apologize to my family and friends: often a seemingly harmless question about my work triggered an over-enthusiastic, lengthy, and mostly incomprehensible answer. By far the greatest burden has been on Wilma. To her, I dedicate this thesis.

List of notations v

1 Introduction and summary 1
  1.1 Introduction ............................................. 1
  1.2 Summary of the following chapters ...................... 3

2 Continuous recourse models 7
  2.1 Stochastic linear programming ......................... 7
  2.2 Fixed recourse ........................................... 14
  2.3 Complete recourse ...................................... 17
  2.4 Simple recourse ......................................... 18
    2.4.1 Fixed technology matrix ............................ 20
    2.4.2 Random technology matrix ......................... 27

3 Complete integer recourse 35
  3.1 Complete mixed integer recourse ....................... 36
    3.1.1 Properties of the value function .................. 36
    3.1.2 Continuity properties of the expected value function 37
    3.1.3 Stability ........................................... 39
  3.2 Algorithms ................................................. 41
    3.2.1 The integer L-shaped method ....................... 41
    3.2.2 Stochastic integer programming by dynamic programming 44

4 Simple integer recourse 45
  4.1 Introduction .............................................. 45
  4.2 The integer expected surplus function ................. 48
    4.2.1 Semi-periodicity: definition and application .......... 58
    4.2.2 Continuity properties .............................. 60
    4.2.3 Differentiability properties ...................... 67
    4.2.4 Convexity on (subsets of) \( \mathbb{R} \) .......... 70
  4.3 The integer expected shortage function .................. 76
4.4 The one-dimensional integer expected value function........... 86

5 Simple integer recourse with random technology matrix ........... 95
  5.1 The integer expected surplus function ....................... 96
  5.2 The integer expected shortage function ....................... 103
  5.3 The one-dimensional expected value function ................. 105

6 The convex hull .................................................. 111
  6.1 Relation to continuous simple recourse ...................... 112
  6.2 Definition and properties of the convex hull ................ 116
  6.3 The convex hull of the one-dimensional expected value function 119
    6.3.1 Example: the exponential distribution .................. 127
  6.4 The convex hull of the expected value function ............... 133

7 Convexity by perturbation of the distribution .................... 143
  7.1 The expected surplus function ................................ 146
    7.1.1 Convex combinations of α-approximations ................ 151
  7.2 The expected shortage function ................................ 154
  7.3 The one-dimensional expected value function ................. 155
    7.3.1 Representation as continuous expected value function .. 158
  7.4 The expected value function .................................. 162
    7.4.1 Optimal values of a simple integer recourse model and its α-approximations .................. 165

Bibliography ....................................................... 167

Index ............................................................... 173

Samenvatting (summary in Dutch) .................................. 175
List of notations

Let $s \in \mathbb{R}$, $t \in \mathbb{R}^n$, $\xi$ a random variable in $\mathbb{R}$, $\tau$ a random vector in $\mathbb{R}^n$, $\varphi$ a real function, and $\alpha \in [0, 1)$.

- $\mathbb{R}$: set of reals
- $\mathbb{R}_+$: set of non-negative reals
- $\mathbb{Z}$: set of integers
- $\mathbb{Z}_+$: set of non-negative integers
- $\mathbb{Z}_-$: set of non-positive integers ($\mathbb{Z}_+ \cap \mathbb{Z}_- = \{0\}$)

- $t_i$: $i$th element of the vector $t = (t_1, \ldots, t_n)$
- $t(i)$: the vector $(t_1, \ldots, t_{i-1}, t_{i+1}, \ldots, t_n) \in \mathbb{R}^{n-1}$
- $cx$, $\langle c, x \rangle$: inner product of the vectors $c$ and $x$

- $n_1$: dimension of vector of first-stage decision variables
- $m_1$: number of first-stage constraints
- $n_2$: dimension of vector of second-stage decision variables
- $m_2$: number of second-stage constraints

- $g$: integer expected surplus function
- $g_\alpha$: $\alpha$-approximation of $g$
- $\bar{g}$: expected surplus function
- $h$: integer expected shortage function
- $h_\alpha$: $\alpha$-approximation of $h$
- $\bar{h}$: expected shortage function
- $Q$: integer expected value function (EVF)
- $Q_\alpha$: $\alpha$-approximation of integer EVF
- $Q^{**}$: convex hull of integer EVF
- $\bar{Q}$: expected value function
- $Q$: one-dimensional EVF
