Key indicators

Single-crystal X-ray study

$T = 100$ K

Mean $\sigma(\text{C}-\text{C}) = 0.004$ Å

R factor = 0.033

wR factor = 0.087

Data-to-parameter ratio = 13.8

For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.

The title compound, $\text{C}_{10}\text{H}_9\text{BrO}_2$, displays an *E* configuration about the $\text{C}=\text{C}$ double bond. In the crystal structure, symmetry-related molecules are linked by $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds, forming centrosymmetric carboxylic acid dimers.

Comment

Cinnamic acid and its derivatives have been reported to possess a variety of pharmacological properties, including hepatoprotective (Perez-Alvarez *et al.*, 2001), antimalarial (Wiesner *et al.*, 2001), antioxidant (Natella *et al.*, 1999) and antihyperglycemic activities (Liu *et al.*, 1999). They constitute a large family of organic acids that have antibacterial, antifungal and antiparasitic activities, as well as antitumour and chemopreventive properties (Liu *et al.*, 1995). The molecular structure of compound (I) is shown in Fig. 1, and selected bond distances and angles are given in Table 1. The $\text{C7}-\text{C8}$ bond length of 1.349 (3) Å shows it to have double bond character, and the configuration about this bond is *E*. The bond lengths within the benzene ring range from 1.389 (4) to 1.403 (3) Å, typical of aromatic character (Allen *et al.*, 1987). Intermolecular hydrogen bonding between carboxyl groups in the crystal structure of (I) results in the formation of dimers. These dimers are further linked by intermolecular $\text{C}-\text{H}\cdots\text{O}$ bonds, forming a chain-like structure. (Table 2 and Fig. 2).

Experimental

Compound (I) was synthesized according to a reported method (Gensler & Berman, 1958). A mixture of 4-bromobenzaldehyde (1.85 g, 10 mmol), methylmalonic acid (2.36 g, 20 mmol) and piperidine (1.98 ml, 20 mmol) in pyridine solvent (12.5 ml) was heated on a steam bath for 24 h. The reaction mixture was cooled and added to a mixture of 25 ml of concentrated HCl and 50 g of ice. The precipitate formed in the acidified mixture was filtered off and washed with ice-cold water. The product was recrystallized from ethanol. The yield was 90%.

 $Z = 2$
 $F(000) = 240$

The final unit cell was obtained from the xyz centroids of 2400 reflections after integration using the SAINTPLUS software package (Bruker, 2006).
 Reduced cell calculations did not indicate any higher metric lattice symmetry and examination of the final atomic coordinates of the structure did not yield extra symmetry elements (Spek, 1988; Le Page 1987, 1988).

 All H-atom parameters refined

$$w = 1/[\sigma^2(F_o^2) + (0.0621P)^2]$$

where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} < 0.001$

$$\Delta\rho_{\max} = 1.14 \text{ e } \text{\AA}^{-3}$$

$$\Delta\rho_{\min} = -0.78 \text{ e } \text{\AA}^{-3}$$

Special details

Geometry. Bond distances, angles *etc.* have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
