**Synthesis**

Unless stated otherwise all reagents were obtained from commercial sources and used as received without further purification. Solvents for reactions were reagent grade and distilled and dried according to standard procedures. Flash column chromatography was performed over silica gel (Aldrich 60, 230-400 mesh) using positive pressure. Solvents for spectroscopic studies were of spectrophotometric grade (UVASOL Merck). NMR spectra were recorded on a Varian Gemini-200 ($^1$H: 200 MHz, $^{13}$C: 50 MHz), Varian VXR-300 ($^1$H: 300 MHz), Varian AMX400 ($^1$H: 400 MHz, $^{13}$C: 100 MHz) or Varian Unity Plus ($^1$H: 500 MHz, $^{13}$C: 125 MHz) spectrometer. Chemical shifts are denoted in $\delta$-units (ppm) relative to the residual solvent peak (CDCl$_3$: $^1$H $\delta$ = 7.26, $^{13}$C $\delta$ = 77.0; DMSO: $^1$H $\delta$ = 2.49, $^{13}$C $\delta$ = 39.5). The splitting parameters are designated as follows: s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, dd = doublet of doublets, br = broad. (HR)MS spectra were obtained with an AEI MS-902. HPLC was performed on a Shimadzu semi-prep system consisting of a LC-20T pump, a DGU-20A degasser, a CBM-20A control module, a SIL-20AC autosampler, a SPD-M20A diode array detector and a FRC-10A fraction collector. Palladium tetraphenylporphyrin,$^1$ motors 1 and 2,$^2$ 9-diazoflourene and ketone 3,$^3$ porphyrins 10 and 11$^4$ and potassium reineckate$^5$ were synthesized according to literature procedures.

Enantioresolution of 2 was performed using chiral stationary phase HPLC: Chiralpak AD column, 99:1 n-heptane:2-propanol, $T$ = 40 °C, flow rate 1 mL/min, retention times 6.5 min ($E$), 7.5 min ($Z$), 9.5 min ($Z$), 13 min ($E$).

To a solution of 6 (50 mg, 0.15 mmol) in THF (2 mL) was added Lawesson’s reagent (74 mg, 0.18 mmol). The reaction mixture was stirred for 3.5 h at 50 °C. The solvent was removed in vacuo and the crude product was purified by column chromatography (SiO₂, toluene, Rₖ = 0.5) yielding 7 (40 mg, 78%) as a purple-red solid. Thioketone 7 could be stored at rt under inert atmosphere for at least three days without degradation. ¹H NMR (300 MHz, CDCl₃) δ 10.15 (d, J = 8.4 Hz, 1H), 8.40 (d, J = 8.1 Hz, 1H), 7.73 (t, J = 7.7 Hz, 1H), 7.56 (t, J = 7.5 Hz, 1H), 6.63 (s, 1H), 4.76 (s, 2H), 3.39 (dd, J = 6.4, 18.1 Hz, 1H), 3.10 (m, J = 7.0 Hz, 1H), 2.81 (d, J = 18.0 Hz, 1H), 1.53 (s, 9H), 1.47 (d, J = 7.3 Hz, 3H); ¹³C NMR (75 MHz, CDCl₃) δ 245.6 (C), 166.9 (C), 161.5 (C), 160.1 (C), 134.3 (C), 131.6 (C), 131.0 (CH), 126.6 (CH), 125.5 (C), 124.3 (CH), 123.1 (CH), 102.1 (CH), 83.2 (C), 66.1 (CH₂), 55.1 (CH), 40.5 (CH₂), 28.3 (3CH₃), 22.0 (CH₃); HRMS (ESI⁺) calcd. for C₂₀H₂₃O₃S [M+H] 343.1362, found 343.1358.
tert-butyl 2-((1-(9H-fluoren-9-ylidene)-2-methyl-2,3-dihydro-1H-cyclopenta[a]naph-thalen-5-yl)oxy)-acetate 8

A solution of 7 (108 mg, 0.316 mmol) and 9-diazo-fluorenone (100 mg, 0.521 mmol) in toluene (10 mL) was stirred at 50 °C for 16 h. The solvent was removed in vacuo and the residue was purified by column chromatography (SiO$_2$, 1:1 heptane:toluene, $R_f$ = 0.2) yielding a mixture of 8 and the corresponding episulfide. This mixture was dissolved in toluene (10 mL) and PPh$_3$ (250 mg, 0.95 mmol) was added and the solution was heated to reflux for 16 h. The volatiles were removed in vacuo and the residue was redissolved in Et$_2$O (10 mL). Methyl iodide (0.1 mL) was added and the mixture was stirred at rt for 3 h. A white precipitate was filtered off and the filtrate was concentrated. Irradiation experiments

UV/Vis absorption spectra were measured on Jasco V-630 spectrometer. Emission spectra were measured using a Jasco FP-6200 spectrofluorimeter. Room temperature phosphorescence spectra were obtained in 1,2-dichloroethane under Argon atmosphere with degassing by at least three freeze-pump-thaw cycles. Phosphorescence lifetimes were obtained using a home built system. Excitation was performed using the second harmonic (532 nm, 10 Hz, 25 mJ, 10 ns) of a Q-switched Nd:YAG laser (Innolas 400) with a Si-diode trigger sensor. The emission from the sample was focused into a Zolix Omni-λ 300 monochromator coupled with a Zolix PMTH-S1-CR131 side-on PMT. Emission decay traces were recorded with 50 Ohm termination on a Tetronix DPO 4032 digital phosphor Oscilloscope and transferred to a PC for data analysis using homebuilt software written in National Instruments LabVIEW 8.2.

Solutions of 1, 2, 12 and 13 were bubbled with Argon for at least two minutes before irradiation. For fluorescence and phosphorescence emission and lifetime measurements, the solutions were deoxygenated with at least three freeze-pump-thaw cycles. For irradiation with a fluorescent
lamp, a 546±5 nm bandpass filter was used and the solutions were cooled to -40 °C using a cryostat. Depending on the concentration, irradiation times were up to 1 h at ~10⁻⁵ M and overnight for samples used for NMR spectroscopy (~10⁻³ M). Laser irradiation we employed at rt with care taken to perform measurements within 30 s of irradiation. In general, PSS was reached within 10 s of irradiation. To be certain photostationary states were reached, several spectra at set intervals were recorded. Thermal isomerization was performed by leaving the solutions in the dark at 20-40 °C for at least 20 min. The solution was then cooled again to the temperature at which irradiation was performed before further measurement.

The photochemical and thermal isomerizations of 2 in chloroform in the presence of PdTPP were also followed using CD spectroscopy (Figure S1). Upon irradiation at 532 nm, a decrease in the intensity is observed, caused by the formation of the thermally unstable isomer. Upon warming, the spectral changes are reverted; a complete recovery is not observed because \( E-2a \) and \( Z-2a \) have slightly different CD spectra.

**Figure S1** Left: CD spectra of \( E-2a \) mixed with 1 equivalent of PdTPP (solid line), the mixture of \( E-2a \) and \( Z-2b \) obtained after irradiation at 532 nm (dashed line) and the mixture of \( E-2a \) and \( Z-2a \) obtained after the thermal step. Right: CD spectra of \( Z-2a \) mixed with 1 equivalent of PdTPP (solid line), the mixture of \( Z-2a \) and \( E-2b \) obtained after irradiation at 532 nm (dashed line) and the mixture of \( Z-2a \) and \( E-2a \) obtained after the thermal step.
Phosphorescence lifetime measurements show quenching of the phosphorescence of PdTPP in the presence of motor 1 (Figure S2). In motor-PdTPP conjugate 12 the quenching is more efficient and the lifetime is reduced further.

Figure S2 Room temperature phosphorescence lifetime measurements of PdTPP (black line), a 1:2.5 mixture of PdTPP and 1 (red line), and 12 (blue line) in 1,2-dichloroethane in Argon-saturated solution. Measured at 710 nm with excitation at 532 nm (6 ns, 10 Hz).

The photochemical quantum yield of the visible light-driven photoisomerization of 12 was determined using potassium reineckate (K[Cr(NH3)2(SCN)4], Φ = 0.29) as a standard. A solution of 12 in 1,2-dichloroethane was irradiated and the change in CD was followed in time (Figure S3). From the comparison to the standard under the same irradiation conditions, the quantum yield was determined to be 0.11±2.

**Control experiments with free-base porphyrin**

To confirm that energy transferred from a porphyrin triplet state, irradiation of PdTPP-motor 12 was repeated with the free-base analogue 13. No changes were observed by CD spectroscopy after 10 s irradiation at 532 nm. Continued irradiation results in a decrease in the intensity across the entire spectrum (Figure S4). These changes are irreversible, even with heating, and are attributed to degradation.

Figure S4 CD spectra of 13 before (black line) and after 40 s irradiation at 532 nm (red dashed line) and after to 40 °C for 20 min (blue dotted line).
Further evidence that energy transfer from the free-base porphyrin does not occur is obtained from the emission spectra of $\text{H}_2\text{TPP}$ and $\text{H}_2\text{TPP}$-motor 13 (Figure S5). From the spectra it is apparent that there is no decrease in fluorescence quantum yield.

**Computational details**
Calculations of triplet excited state energy and CD spectra were performed using the Gaussian 09 program. Geometry optimizations were performed on B3LYP/6-31G(d,p) using tight convergence criteria. Frequency analysis was performed on the optimized structures to ensure a true energy minimum was reached. CD spectra were calculated on B3LYP/6-31G++(d,p) and normalized to the highest band in the experimental spectrum.
