Glycolytic oligodendrocytes maintain myelin and long-term axonal integrity. 

Expression of stathmin, a developmentally controlled cytoskeleton-regulating protein, has been shown to be critical for oligodendrocyte survival and differentiation. Stathmin depletion promotes filamentous actin polymerization and inhibits myelin formation in organotypic cerebellar slices. 

Beta 1 integrin-dependent and -independent polymerization of fibronectin is essential for development but dispensable for fibril assembly. 

Integrin dynamics and matrix assembly: tensin-dependent translocation of alpha(5)beta(1) integrins promotes early fibronectin fibrillogenesis.
