Using I-FABP as a proxy, intraoperative intestinal integrity compromise was shown in patients undergoing surgery for solid malignancies. Older age, longer procedure duration, and the development of postoperative

complications were associated with stronger I-FABP increase (<https://doi.org/https://doi.org/10.1245/s10434-023-14857-7>).

**FUNDING** Prof. Anthony Absalom’s department received reimbursement for consulting work performed for PAION, Terumo, Ever, and Philips. In addition, he has performed sponsor-initiated research (reimbursements to the department) for Rigel Inc and Philips.
