General Methods. Melting points were determined on a Kofler block and are uncorrected. The optical rotations were measured on a Perkin-Elmer 241 polarimeter; the \( [\alpha]_D \) values are given in 10\(^{-1}\) deg cm\(^2\) g\(^{-1}\). The \(^1\)H NMR spectra were recorded on Bruker AMX 200 and 400 spectrometers for CDCl\(_3\) or CD\(_2\)Cl\(_2\) solutions. FTIR spectra in solution were measured on a “Magna-IR 750” spectrometer (Nicolet) with a resolution of 2 cm\(^{-1}\). UV spectra were measured on “Specord M-40” spectrometer. The spectra of solvents were subtracted using a standard OMNIC program. The CD spectra were obtained on spectropolarimeter JASCO, J-600. Chiral GLC analyses\(^{21}\) of the amino acids were performed on a Chirasil-L-Val type phase, by using \( n \)-propyl esters of \( N \)-trifluoroacetyl derivatives of amino acids. All manipulations were performed under dried and deoxygenated argon. CHCl\(_3\) was distilled from CaH\(_2\) and kept over molecular sieves. Reactions were carried out in a flame-dried round-bottomed flasks equipped with a magnetic stirring bar and a water-cooled reflux condenser. All the reagents, including 2,2’-dihydroxy-1,1’-binaphthyl (BINOL, 31b), 2,2’-diamino-1,1’-binaphthyl (31c), and solvents were purchased from Aldrich unless indicated otherwise. TADDOL (30) and NOBIN and iso-NOBIN derivatives 31a,\(^{19h}\) 31d,\(^{19g}\) 31e,\(^{19h}\) 32a,\(^{7b}\) 32b,\(^{7b}\) and 32g\(^{7b}\) were available from previous work. The crystallographic data for 1 and 3a are presented in Table 1. Structures were solved by direct method and refined by full-matrix least squares against \( F^2 \) in the anisotropic (H-atoms isotropic) approximation using SHELXTL–97 package. The analysis of the Fourier electron density synthesis have revealed that N(1)-C(5) and C(7)-C(12) rings in the ligand in 2 are disordered by two positions, which were included in refinement in anisotropic approximation with equal occupancies. All hydrogen atoms in the ordered part in 1 and 2 were located from the electron density difference synthesis and were included in the refinement in isotropic approximation. The X-ray data for 32b, 32d, and 32f were obtained at 150K using Oxford Cryostream low-temperature device on a Nonius KappaCCD diffractometer with Mo K\(\alpha\) radiation (\( \lambda = 0.71069 \) Å), a graphite monochromator, and the \( \phi \) and \( \omega \) scan mode. The enantiomeric purity of amino acids was determined by chiral GLC analysis on chiral Chirasil-Val columns.
Investigation of the Interaction of Sodium NOBIN-ate with 1 by NMR. Four samples were prepared in CD$_2$Cl$_2$ as follows: A: a solution of sodium salt of (R)-NOBIN (0.157M), generated from NaH; B: a saturated solution of Ni-PBP-Gly (0.0088M; 0.7 mL); C: solution B (0.7 mL) was mixed with solution A (0.04 mL) directly in the NMR sample tube immediately before recording; D: solution A (0.08 mL) was added directly to the NMR tube containing solution C immediately before recording.

Solubility Experiments. The concentration of the saturated solution of Ni-PBP-Gly, 1, [lgc ($\lambda_{max}$) 3.6 (453 nm)] was estimated as 0.00237 M. Four solutions (1 mL each) of (R) or rac-NOBIN of 0.01M, 0.05M, 0.1M, 0.15M concentration, respectively, in 1,2-dichloroethane were prepared and sodium hydride (100 equiv relative to NOBIN) was added under Ar. After stirring for 5 minutes, solid 1 (0.1 mg, 0.24 mmol) was added to each sample. The sample were vigorously stirred for 1 h and then filtered in order to determine their molar concentration by UV. The dependence of solubility of 1 on the concentration of the sodium salt of NOBIN was found to be a straight line with b = 0.391 and S = ±0.008 obtained by the least square method.

Ni-PBP-Gly (1): was synthesized using a modification of a procedure described previously. To a stirred solution of 7 (70.0 g, 0.232 mol or an equivalent of its hydrochloride), Ni(NO$_3$)$_2$.6H$_2$O (74.2 g, 0.255 mol) and glycine (19.14g, 0.258 mol) in MeOH (400 mL) was added a solution of KOH [71.4 g, 1.28 mol (greater amounts if hydrochloride of 7 was used)] in MeOH (250 mL). The mixture was refluxed for an additional 30 min, cooled to room temperature and AcOH (72 mL) was added. The solution was diluted with water (1 L) and a red-colored precipitate of 1 was filtered off, washed with distilled water (3 × 150 mL) and dried on air, giving 1 (93.6 g, 0.225 mol, 97%). 2-Amino-pentanedioic Acid (Glutamic Acid) (40a) was released, as described in the typical procedure (see above), from 38a (the Michael adduct of 1 and methyl acrylate 37a), to obtain glutamic acid (S)-40a (87%), which was of 94% ee according to chiral GLC (see above). Recrystallization from MeOH-H$_2$O gave 99% ee in 52% yield.

2-Amino-5-oxo-5-piperidin-1-yl-pentanoic Acid (±)-(40d) was released, as described in the typical procedure (see above), from the corresponding Michael adduct of 1 and 37d to obtain the amino acid in 84% yield. Recrystallization from EtOH gave (±)-40d (52%): mp 172-173 °C; $^1$H NMR (400 MHz, D$_2$O) δ 1.2-1.31 [m, 6H, 3 × CH$_2$(pip)], 1.78 (m, 2H, β-CH$_2$), 2.26 (m, 2H, γ-CH$_2$), 3.15 [m, 4H, CH$_2$(pip)], 3.44 (t, $J = 6.0$, 1H, α-CH).
