“Progress in many fields of inquiry is measured not by mere discoveries (however enumerated) but by the deepening of the questions people ask of nature. It is no scandal that many of the questions now in people’s minds are extensions of questions asked by Aristotle and his contemporaries. They have become more interesting questions, and they are more taxing. Quite apart from the clamant demand for more applications of science, there is also not yet an end in sight to the process of inquiry. The problems that remain unsolved are gargantuan. They will occupy our children and their children and on and on for centuries to come, perhaps even for the rest of time.” [Sir J. Maddox]

Somewhere in this process, approximately 4 years ago, I also, entered this stage of questioning how nature works and hopefully helped in my own little way to deepen the questions we ask. Four years I’ve been studying several aspects in biology and although the nature of the questions varied a lot, all answers were inferred from studies performed in Drosophila. However, non of the answers presented in this thesis were possible without help of the following people, whose combined activities converged in space-time and that allowed the creation of a moment in time in which these answers represent the truth and therefore deepened the original questions.

Firstly, I like to thank Drosophila melanogaster, as a species oppressed in laboratories everywhere around the world for more than a century by cruel and crazy scientist, these bugs are truly the victims of systematic mass murder and their contribution to science should not be underestimated.

Nonetheless, doing research with flies is, however unfortunate for them, fun to do and therefore I like to thank my supervisor/copromotor dr. Ody C.M. Sibon who made it possible for me to date flies. Ody, perhaps the best compliment is that I adopted the fly as my favorite model to conduct cruel and oppressive, however elegant research far into the 21st century. At least I hope.

Special thanks to my promotor prof. dr. Harm H. Kampinga. Harry, although your group is engaged in studying the mechanisms that cope with misfolded proteins in cells, which was not my subject, your enthusiasm, support and work with one of your staff members (not only lab work) after nine o’clock, not only resulted in a nice paper or helped in finishing this thesis, but also something more.

Also a big thanks to my former supervisors, Marjon and Rick, not only for providing me with the necessary references, but also for teaching and stimulating me to do science.

The work presented in this thesis is also due to the dedicated work of some graduate students: Edwin, Sjoerd, Nynke, Patries, Petra and Anil, all a big ‘thank you’ and I hope you’ll do fine in your future jobs. Hopefully science. Anil special thanks to you; it was a joyful and successful time having you around in the labo and I wish you, now working as a PhD student and continuing the work presented in this thesis, good luck.

In addition to this, I also like to thank Erwin and Kasia, who are also continuing to work on the coenzyme A pathway in flies. To my roommates, again Anil, Kasia, Erwin, but now also including Xia thank you for your advice, discussions, wise words, laughter and working together. Without you guys working in the office or flylab would have been very unpleasant indeed.

To continue on this I would also like to thank the following people for discussions, ideas, sharing moments of laughter in either the labo, the pub (abroad or in Groningen), the basement or some place else and that all, in someway contributed to the realization of this thesis in a pleasant way: Annet, Anne Jan, Anil, Bart, Bert, Bianca, Dirk, Edwin, Emile, Erwin, Florian, Gerald, Gerry, Hette, Isabelle, Joyce, Jurre, Jaenette, Kasia, Karin, Karin, Krzysztof, Lenya, Lisa, Maarten,
Acknowledgements

Maria, Maria, Marianne, Martha, Michel, Nynke, Patries, Patrick, Petra, Piet, Ria, Rita, Rob, Rogier, Sjoerd, Tineke, Vangelis, Willy, Xia.

I also would like to thank my family; my sister and mother for their support and especially my father whose homemade/autodidactic scientific analyses and questions can be quite challenging and interesting, and my brother whose trips between Groningen-Deventer always provided me with an excellent opportunity to escape the Drosophila’s.

Special thanks to my paranymphs, Willy and Hette. Willy, your unlimited source of energy and dedication to your work is unprecedented. It was an honor to work with you and I hope that, when I slowly age, I gain some of your outlooks on life and science. Hette, although we were engaged in totally different fields of research, we shared many good moments together, not only inside the labo, but also on many occasions outside the labo. Moments I’ll never forget: having a BBQ on your 2 m² balcony, pogo dancing and sailing in Friesland, holidays in Stockholm. Together with Ria, Rita, Maria, Florian and Jurre, we emptied many beers in the nightlife of Groningen.

Last but not least, I would like to thank you Maria and Simon. My Caribbean queen, together with Florian and a wild idea, it was your beauty that lured me into doing a lot of extra work after nine o’clock. Initially, only in the labo and occasionally in the Groningen nightlife, but after about 2½ years also in other places….. Our working together resulted not only in good research, but also something more lasting. I am really happy that I met you and also Simon. Little man, although we only share about 1 year together now, I hope we that we’ll share many more with the three of us.
