Microbiology

SecD and SecF plays an important role in SecDF functioning. 

translocation across the cytoplasmic membrane of proteins regulated by the temperature.

aureocin A70, a multi-peptide bacteriocin isolated from located fibrinogen-binding adhesin of Enterococcus faecalis signal peptides and prediction of their cleavage sites.

Calcium promotes sorting signal binding by altering the mobility and structure of an active site loop.

analysis of aureocin A53, a new, atypical bacteriocin from Staphylococcus aureus by whole-genome sequencing.

paradigm.

Proteolytic cleavage and cell wall anchoring at the LPXTG motif of surface proteins in gram-positive bacteria. Mol Microbiol 14: 115-121.

Identification of prokaryotic and eukaryotic signal peptides and prediction of their cleavage sites. Protein Eng 10: 1-6.

Disruption of the gene encoding pil2 (SecG) reveals the direct involvement and important function of SecG in the protein translocation of Escherichia coli at low temperature. EMBO J 13: 3272-3277.

The large first periplasmic loop of SecD and SecF plays an important role in SecDF functioning. J Bacteriol 187: 5857-5860.

Proteome analysis of extracellular proteins regulated by the las and rhl quorum sensing systems in Pseudomonas aeruginosa PA01. Microbiology 149: 1311-1322.

Reference list
Chapter 10

biofilm formation via proteolytic processing of the accumulation-associated protein by staphylococcal and host protein factors in biofilm accumulation of Staphylococcus aureus from prosthetic hip and knee joint infections.
