Acknowledgements

My debts are deep as penning a research investigation of the scope that includes topics, which on setting out, I had only little familiarity with required help. I was fortunate enough that I embarked on my research work at the lab of molecular microbiology at GBB where Prof. Arnold Driessen, my promoter and head of the research group allowed me not only an unusual degree of freedom in pursuing divergent research ideas but also subtly ensured that guidance and supervision came from both expected and unexpected quarters. I am especially grateful for his infinite enthusiasm, critical input and confidence in the importance of this thesis.

The biological center/GBB turned out to be a fairly lively, congenial place to think and work. I thank the many friends, colleagues and students from the recombinant worlds of microbiology and molecular biology as well as from biochemistry who helped me get my bearings amid a wash of tools and technicalities. I would like to express my special thanks to Dr. Patrick Bakkes, my lab supervisor. I am particularly inspired by his dedication, meticulous attention to detail and astute guidance which was crucial to many a scientific forays and whose editing skills were especially helpful in articulating the complex issues addressed in this work. My research collaboration with UMCG was made possible by Dept. of biomedical engineering's Prof. Henny van der Mei and Dr. Bastiaan Krom who welcomed me in their lab with much enthusiasm and served as excellent guides in introducing me to the extraordinary realm of physiochemical microbiology.

Over the years and in a more broader context, several people have had a distinct influence on my thinking, in some cases from personal contact and interactions as well as through their writings. I would like to especially mention the names of the writer George Salibas, the Pakistani academics Dr. P. Hoodhbuy, Dr. S. A. Hasan and Dr. A. H. Hafeez in this regard. I hope to emulate them more and to them I owe a special debt of gratitude. There are many others who deserve mentioning for their company and support throughout this time period between 2006 and 2011 that I spent in Groningen.

I will particularly take this space to express my gratitude to comrade Rustem, my friends, colleagues and country men (هم وطن) Latif, Ikram, Irfan, Adnan and Munir for sharing their thoughts and opinions about everything! Special thanks to Patrick and Jan peiter for making the dutch translation of the summary and A.R. Khan, Deputy Director of the National Language Authority, Pakistan for helping with its urdu translation.

Financial support, a critical component of any scientific venture cannot be understated. For this particular undertaking, the finance was provided by the 'overseas phd program' of the Higher Education Commission (HEC), Govt. of Pakistan administered through the offices of NUFFIC. The timely disbursement of funds greatly helped in the successful completion of the research and the thesis. I would also like to thank Dr. Engel Vrieling, coordinator of PhD programs at GBB and the secretarial staff (Bea and Manon) for providing the necessary administrative support in creasing out many of the bureaucratic kinks associated with the implementation of such 'country to country' projects.

To gather up, finally, the most traditional intertwining of human relationships, I thank my parents and all the family members as without their support, encouragement and love this undertaking would have been impossible and pointless. I am particularly indebted to my parents who have always supported me in every endeavor and who remind me that the world still awaits me along the banks of the river Indus.

“More is owing to what we call chance that is, philosophically speaking, to the observation of events arising from unknown causes, than to any proper design, or preconceived theory”
