# Acknowledgments

This thesis and the articles this thesis is based on have only a single author. But of course this does not mean that I could have written them without the help of others. Let me therefore spend a few lines thanking people.

Firstly I would like to thank Barteld Kooi, my promotor. Over the past four years you have always been confident in my ability to complete this thesis, even when I sometimes had my doubts. You turned out to be right. You also spent an impressive amount of time reading and commenting on drafts of my papers.

I would like to thank Allard Tamminga, my copromotor. Your constructive criticism has helped me improve this thesis significantly. I am also thankful to you for pointing out that even if  $\diamond$  would have quantified over all APAL formulas it would not have been *completely* arbitrary because it does not quantify over cucumbers.<sup>1</sup>

I am thankful to Johan van Benthem, Rineke Verbrugge and Thomas Ågotnes for agreeing to form the assessment committee for this thesis. You invested a significant amount of time and effort in doing so. Furthermore, the feedback you gave was extremely useful. I am also thankful to a number of anonymous referees that reviewed the papers that ended up forming most of this thesis. You too spent a lot of time checking my work.

I also thank my colleagues for their support. There are too many of you to mention you all by name, but I am quite sure that you know who you are. There are three groups of colleagues that I would like to mention specifically though. Members of the PCCP, the Work in Progress group<sup>2</sup> and the OBP: thank you.

My family, I would like to thank you for maintaining an intellectual climate that encourages curiosity. Henk en Wiesje, I don't think it is a coincidence that of your four children one already has a PhD and another is about to obtain one. You almost certainly played an important role in those achievements and you can be proud of that. Lenneke, thank you for starting as a PhD student a few years before me. Nothing motivates one to work quickly and diligently quite like a sibling who is slightly ahead.

I would also like to thank a few people who fit in none of the above categories. Jaap Top, thank you for encouraging me to apply for a PhD student position in logic. Donald Knuth and Leslie Lamport, thank you for your roles in developing  $\text{T}_{\text{E}}\text{X}$  and  $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$ . Without those tools it would have been almost impossible to write this thesis. Finally let me thank you, the reader. Without you this thesis would be rather pointless.

---

<sup>1</sup>Some people might think I am joking. They would be wrong.

<sup>2</sup>The WiP group also contains a few students who are not, strictly speaking, my colleagues. If you are one of them, then thank you as well.
