## Acknowledgements

There are a number of people who I want to thank for making contributions to the completion of this dissertation. Most of all, I would like to thank my supervisors, Casper Albers and Marieke Timmerman, who have been involved in this dissertation every step of the way.

Without Casper Albers this dissertation project would not have come to be. Not only because the project idea was largely his, but also because he already served as a supervisor for my Bachelor and Master theses. As a Bachelor student I showed up to his office one day asking if he would be interested in supervising a Bachelor thesis about statistics. I remember being concerned that he would not want to supervise my Bachelor thesis because he would not be awarded teaching credits — clearly I had not met Casper yet. I am deeply grateful to Casper for his infectious enthusiasm and for having been a supportive mentor. Casper has always made time to help me develop my ideas.

I am deeply grateful to Marieke Timmerman for the patience she has shown and the time she has invested to always provide me with feedback. I am thankful for everything I have learned from Marieke, from writing more clearly to approaching my academic tasks in an efficient way. Marieke often pushed me when it was to my benefit but she also provided me with support when I needed it. I believe every time someone asked me how I got along with Marieke I repeated the same thing: “I could not wish for a better supervisor”.

I also owe my thanks to Bertus Jeronimus for his support on three chapters of this dissertation. In each of these chapters he has given the results of the clustering analysis an interesting interpretation. I appreciate Bertus for having been a kind, reliable, and enthusiastic collaborator who has always been encouraging of my research interests.

I am grateful to Sophia Rabe-Hesketh for hosting me at the University of California Berkeley. I also want to thank Feng Ji from the University of California Berkeley for contributing to a chapter of this dissertation.

I would also like to thank the members of my assessment committee, Eva Ceulemans, Ellen Hamaker, and Peter de Jonge for having taken the time to read and assess my dissertation.

I am thankful for my current and former colleagues at the Psychometrics and Statistics Department at the University of Groningen. I am happy that I will continue to be a colleague to many of them after my PhD has finished. Particularly, I would like to thank my office mate, Sebastian Castro Alvarez, for having been amazingly supportive and also for serving as a paronym on my defense.

I owe gratitude to my family and friends for their encouragement throughout the completion of my dissertation.

Lastly, I want to thank my partner for his love and support.
