**Soft-bottom intertidal ecosystems  
shaped by ecosystem engineers:**  
Consequences for trophic structure

Research presented in this thesis was conducted at the Department of Marine Ecology (MEE), Royal Netherlands Institute for Sea Research (NIOZ) and the Department of Animal Ecology, Centre for Ecological and Evolutionary Studies (CEES), University of Groningen. The research was funded by a grant from the Netherlands Organization for Scientific Research (NWO-ZKO: 839.08.310). The printing of this thesis was funded by the Royal Netherlands Institute for Sea Research (NIOZ) and the Faculty of Mathematics and Natural Sciences of the University of Groningen.

# Contents

Chapter 1	Introduction	9
Chapter 2	Cross-habitat interactions among bivalve species control community structure on intertidal flats	21
Chapter 3	Spatially extended habitat modification by intertidal reef-building bivalves has implications for consumer-resource interactions	39
Chapter 4	Caught in the middle: How predation, competition and ecosystem engineering interactively structure an intertidal bivalve population	55
Chapter 5	Biotic structure and sediment stability facilitate benthic species and trophic diversity in an intertidal soft-bottom ecosystem	67
Chapter 6	Predation and habitat modification interact to control bivalve recruitment on intertidal mudflats	85
Chapter 7	Hierarchical habitat modification shapes food web structure over long timescales	97
Chapter 8	Synthesis	119
