# **Effects of vegetation patterns and grazers on tidal marshes**

Kelly Elschot

rijksuniversiteit  
 groningen

Royal Netherlands Institute for Sea Research

This PhD project was carried out at the Community and Conservation Ecology group, which is part of the Groningen Institute for Evolutionary Life Science (GELIFES) at the University of Groningen, The Netherlands. The research was conducted in cooperation with the Spatial Ecology Group at the Royal Netherlands Institute for Sea Research (NIOZ-Yerseke), The Netherlands.

This project was funded by the Dutch Organization for Scientific Research (NWO-ZKO), project number 83908320. It was further supported by the Schure-Beijerinck-Popping fonds.

The printing of this thesis was partially funded by the University of Groningen and the Faculty of Mathematics and Natural Science.

# Contents

<i>Chapter 1</i>	General introduction	7
<i>Chapter 2</i>	Effects of long-term grazing on sediment deposition and salt-marsh accretion rates	17
<i>Chapter 3</i>	Experimental evidence for top-down control of carbon stocks in a tidal salt marsh	31
<i>Box 1</i>	Small-scale topographic heterogeneity in European sandy salt marshes	51
<i>Chapter 4</i>	Positive effects of small-scale topographic heterogeneity on plant diversity and grazers throughout marsh development	61
<i>Chapter 5</i>	Scale dependence of top-down vs. bottom-up control of plant composition and grazer abundance: a long-term case study on a tidal wetland ecosystem	83
<i>Chapter 6</i>	General synthesis: vegetation patterns and grazers on tidal marshes	101
