## **ACKNOWLEDGEMENTS**

---

To acknowledge could be a very difficult task. Not because I don't want to it, just because many make this work directly possible and many other help indirectly to this thesis. I will try to include everyone and I will probably fail. This thesis is the results of many different thinking-heads. Sometimes all together, sometimes fighting each other, but finally able creating results and ideas.

First of all I have to acknowledge to the lab team in Groningen, first because they accepted me. They gave me space and tools for work. Petra Ottens teach me and help with animal experiments, molecular work, practical issues and a lot of orientation during my stay in the Surgical Lab. Most important she was always kind when I came up with non-smart questions or problems. Thank you very much. Susanne Veldhuis teach me, help me and tolerate my learning curve during the animal experiments. Thank you very much for that. Janneka Wiersema-Buist was able to produce such beautiful histological images (even when she did think so) that allow us to better understand BD physiology. Jacco Zwaagstra always helped to control my own chaos and put that chaos to work, safely and in an organized fashion.

Any of these ideas would be created without good and open thoughts exchange. My colleagues were very important in that aspect. Paria Mahboub, Negin Karimian and Leon van Dullemen were, during my Groningen period, very important exchangers; lots of ideas come in and out. Fortunately many of those ideas were created out of the lab, as in meetings, travels, dinners and, of course, parties. Maximilia Hottenrott and Dane Hoeskma were there to share work, music, stories and many hours in the lab. Each of you in different ways put lot of effort in our shared work. Thank you very much to you both.

An special mention to Anne van Erp (van Fast). First of all, she accepted to work with the new guy from south-america. As far as I know without complains. Second, she even listened and payed attention (or seemed to) what he wanted to say. Moreover and even worst, she followed some ideas and some projects. Seriously, thank very much for your work and effort. I'm sure that the last part of this thesis wouldn't be possible without your help and always-positive spirit. Excellent co-worker, could be with Leon, Nichlas or Albert but work, run or just have a good time was easier if you were there. Thank you very much.

I would like to thanks Zeehan Akhtar for his kind invitation to Oxford, for our shared work and our sincere talks about science, physiology, surgery and life. Prof. Rutger Ploeg hosted Leon and me during our trip to Oxford and shared with us interesting thoughts about medicine and research. I appreciated it.

Because this thesis work was made partially in Aarhus, Denmark I would like to specially acknowledge the danish team. Prof. Bente Jespersen kindly accepted our project and help us to implement, even more she accepted to be my Danish supervisor. I'm very grateful with her, she dedicate time and important thoughts to this thesis, even when she knew that I'm a liver fan and I knew that she is a kidney lover. Christoffer Lautsen and Michael Pedersen designed the experimental protocol and trained me in utilization

of the MR scanner. Both were quite open to receive new ideas and fortunately, very patient to listen many question. Rikke Nørregaard acted as a médium in many cases, even before my arrival. Helped us to organize and plan the experiment improving our model and work, all these with an excellent sense of humor. Ilse Rasmussen was one of the friendliest coworkers, helping us to organize and find solutions were we just found problems. Nichlas Riise an excellent colleague, funny, smart and enthusiastic. Was a great opportunity to meet you there and share work with Giorgio and Achmed.

I received help from the other side of the world as well. Prof. Pamela Romanque as my Chilean supervisor helped me to better understand a fascinated organ like liver. Prof. Ramon Rodrigo always available for questions and orientation. Helped me to combine both works and be able to achieve Dutch and Chilean requirements.

My huge family in the form of a conglomerate was, is and will be with me. From my grandfathers to my brothers and sisters. My family is always wondering about my projects and goals, pushing me to achieve them. This conglomerate shares his world, each of you contributed to this work. As you know, dogs do not make cats! Thank you all.

Intentionally I left him almost to the end of this section. Prof. Henri Leuvenink gave me the opportunity to do my PhD thesis with him. An unknown student from a long a thin country next to the Andes and to the Pacific Ocean. His human quality motivated me to overcome all my handicaps (which is still an ongoing task). He become more than a thesis supervisor, he is a guide that can lend a hand in- or outside of the lab. As my Dutch PhD supervisor, his guide (active or not) was fundamental for this work. Many times just by talking with him I started to have more ideas and wanted to do something new, something extra. In his pro-independent model of teaching I had to learn how to deal with my/his ideas and choose a path to follow. I think he knew that from the very beginning but left to me the opportunity to discover, to try and to screw up. Thank you very much.

Finally I would like to acknowledgements Ximena Martorell my partner, my friend, my couple, Simon's mom and my love. She decided to join me in this crazy idea to Groningen. She decided to stay and even more decided to stay with me those years and then comeback also with me to Chile to star a family. I couldn't be more grateful with you and your clarity to affront some problems, the way that you help to change huge conflicts into little fights, your excellent instinct and goodwill. This thesis wouldn't be possible without you there. Always supportive and good listener. My deep love to you.

## PROPOSITIONS

1. During brain death, the liver acts in solidarity with others organs.
2. Organs suitable for transplantation, suffer from brain death with different intensity (and form).
3. In brain death not everything is inflammation.
4. Single or multi-organ preconditioning can be difficult within the brain dead donor.
5. Mean arterial pressure not always reflects organ perfusion.
6. Mitochondrial dysfunction seems to be affordable.
7. We have to do, what we have to do (J. Cornejo. Chilean Surgeon).
8. To successfully perform a PhD in the Netherlands follow this rule: Fill the form and be on time.
9. I prefer chaos instead of this awful reality (M. Redolés. Chilean Poet).
