Viruses as a tool in nanotechnology and target for conjugated polymers

Agnieszka Gruszka

1. The use and applicability of viruses is mainly restricted by our own imagination.
2. Combining proteins with SWCNTs is not only difficult on an experimental level, but also presents some cultural hurdles.
3. The antiviral drug development largely relies on “one bug-one drug” paradigm, which may be inadequate to compete with evolution of viruses.
4. We are still much better in creating hybrid materials than in developing techniques to characterise them.
5. Creating social networks without investing time in meaningful relationships likely won't bring the expected benefits.
6. It is good to finish your PhD and leave the group before the whole group wishes you to leave more than you do yourself.
7. Close collaborations in a group are challenging to balance. Personal favours are too often being mistaken as collaboration and vice versa.
8. Doing is better than trying, even not doing is better than trying.
