The work presented in this thesis was performed in the Micromechanics research group at the Zernike Institute for Advanced Materials (ZIAM) of the University of Groningen, The Netherlands. ZIAM is acknowledged for funding this research through the bonus incentive scheme. This work was sponsored by NWO Exacte Wetenschappen (Physical Sciences) for the use of supercomputer facilities.

Computational Studies of Influenza Hemagglutinin

How Does it Mediate Membrane Fusion?

PhD thesis

to obtain the degree of PhD at the
University of Groningen
on the authority of the
Rector Magnificus Prof. E. Sterken
and in accordance with
the decision by the College of Deans.

This thesis will be defended in public on
Friday 22 December 2017 at 11.00 hours

by

Sander Boonstra

born on 26 November 1985
in Leens, The Netherlands

Supervisors

Prof. E. van der Giessen

Prof. P.R. Onck

Assessment committee

Prof. S.J. Marrink

Prof. W.H. Roos

Prof. A. Kros

Contents

1	Introduction	1
1.1	Influenza viral entry and replication	3
1.2	Entry inhibition	4
1.3	Hemagglutinin-mediated membrane fusion	4
1.4	Molecular dynamics simulations	6
1.5	Thesis outline	6
	References	7
2	Hemagglutinin-mediated membrane fusion: A biophysical perspective	11
2.1	Introduction	12
2.2	Membrane fusion	13
2.2.1	Pathway	13
2.2.2	Methods	14
2.2.3	Barriers	15
2.3	Hemagglutinin conformational changes	17
2.3.1	Structure and triggering	17
2.3.2	Pathways of the conformational change	18
2.3.3	Surmounting membrane-fusion barriers	20
2.4	Stochastic modeling of influenza fusion	21
2.4.1	Single-particle kinetic assays	21
2.4.2	Influenza fusion mediated by a cluster of stochastically inserted hemagglutinins	22
2.5	Future directions	25
	References	26
2.A	Appendix: Tables	38
3	CHARMM TIP3P water model suppresses peptide folding by solvating the unfolded state	41
3.1	Introduction	42
3.2	Method	42
3.2.1	Water models	43
3.2.2	System setup and equilibration	43
3.2.3	Replica exchange molecular dynamics	43
3.2.4	Definition of folded states	44
3.2.5	Convergence	44
3.3	Results	44
3.3.1	Melting curves	44
3.3.2	Characteristics of the unfolded state	45

3.4	Discussion	49
3.5	Conclusion	51
	References	51
4	Critical interactions in the globular bottom of influenza hemagglutinin	55
4.1	Introduction	56
4.2	Methods	58
4.2.1	Simulation setup	58
4.2.2	Analysis of simulation results	61
4.3	Results	63
4.3.1	Unfolding pathway of the globular bottom of H3	63
4.3.2	Identification of critical interactions	64
4.3.3	Salt-bridge network	66
4.3.4	Mutation studies	69
4.3.5	Protonation studies	69
4.3.6	Conservation of stabilizing amino acids	70
4.3.7	Stability of the globular bottom of H1	71
4.3.8	Single-particle experiments	72
4.4	Discussion	73
4.5	Conclusion	77
	References	77
4.A	Appendix: Single-particle assay	82
4.B	Appendix: H1 homology modeling	85
4.C	Appendix: Constant pulling rate simulations	86
4.D	Appendix: Tables	87
5	Computation of hemagglutinin free energy difference by the confinement method	89
5.1	Introduction	90
5.2	Methods	92
5.2.1	Confinement free energy method	92
5.2.2	Thermodynamic integration and MBAR	94
5.2.3	Guidelines for free energy calculation	96
5.2.4	Equilibration and decorrelation of time series	96
5.2.5	Crystal structures and simulation setup	96
5.2.6	Window spacing and overlap coefficient	98
5.3	Results	99
5.3.1	Energy minimization	99
5.3.2	Confinement to the harmonic regime	100
5.3.3	Confinement free energies	101
5.3.4	Convergence: overlapping distributions	102

Contents

5.3.5	Convergence: equilibration and sampling	104
5.3.6	Conformational free energy difference	105
5.4	Discussion	106
5.5	Conclusion	109
	References	109
5.A	Appendix: Error propagation	115
5.B	Appendix: Force field and MD code selection	116
5.C	Appendix: SHAKE test case	117
	Summary	119
	Samenvatting	121
