Corrigendum to “Take a look at the bright side: Effects of positive body exposure on selective visual attention in women with high body dissatisfaction” [Behav. Res. Therapy 83 (2016) 19–25]

Klaske A. Glashouwer^{a, b, *}, Nienke C. Jonker^a, Karen Thomassen^a, Peter J. de Jong^a

^a Department of Clinical Psychology and Experimental Psychopathology, University of Groningen, The Netherlands

^b Center for Eating Disorders, Accare, Child and Adolescent Psychiatry, The Netherlands

The authors regret that they made an error in the power calculations of this paper due to choosing the standard option for repeated measures within x between power calculation in G-power 3.1 (“as in G-power 3.0”) which should have been adjusted (to “as in SPSS” or “as in Cohen (1988)”). The sample sizes that we reported in the manuscript should have been $N = 34$ (instead of $N = 20$, p. 21) and $N = 56$ (instead of $N = 34$; p. 21). And post-hoc power should have been 0.50 (instead of 0.72; p. 21 and p.24). However, we do not think this mistake alters the main conclusion of the paper: At baseline we found large differences in viewing patterns between groups. In addition, the body exposure training showed large effects on reducing shape concern and eating disorder symptoms, whereas we did not find such an effect on viewing patterns. When spontaneous viewing patterns would be a critical factor in improving body satisfaction, one would expect large(r) differences in viewing patterns over time as well. The authors would like to apologise for any inconvenience caused.
